Abstract

This guide details the integration between Amazon Connect and Salesforce Lightning. It covers the installation, configuration, and operation of the two primary components of the integration: the Amazon Connect CTI Adapter for Salesforce and the AWS Serverless Application Repository for Amazon Connect Salesforce integration.

- Key Benefits and Requirements
 - Requirements
 - Prerequisites - Amazon Connect CTI Adapter
 - Prerequisites - AWS Serverless Application Repository for Salesforce
 - Browser Compatibility
 - Salesforce Lightning Support
- Installing CTI Adapter Managed Package from AppExchange
 - Installing the Package
 - Set Access Permissions
 - AC_Administrator
 - AC_Manager
 - AC_Agent
 - Configure the Lightning Experience
 - Configure Service Console
 - Allowlist Your Salesforce Org with Amazon Connect
 - Modify the Call Center
 - Configure the Toolkit settings
 - Create the Softphone Layout
 - Initial CTI Adapter Configuration

- Add the CTI Adapter Console App
- Enhanced Agent Logout
- Validate Basic Screenpop
- Installing the Amazon Connect Salesforce Lambda Package
 - Prerequisite Configuration and Data Collection
 - Check your Salesforce API Version
 - Create a New Connected App
 - Create a new API user
 - Gather Information from Your Amazon Connect Instance
 - Store Salesforce Credentials in AWS Secrets Manager
 - Install the Amazon Connect Salesforce Lambda package
 - Test the Core Functionality
 - Validate the core functionality
 - Allow Amazon Connect to Access the sfInvokeAPI Lambda Function
 - Add the Lambda function to your Amazon Connect instance
- Upgrading from an Earlier Version
- CTI Adapter Installation Troubleshooting and Common Issues
 - I upgraded my adapter to v5.10, but I cannot see the CCP Config changes
 - Error "refused to run the JavaScript URL because it violates the following Content Security Policy directive..."
 - Error "refused to frame" Visualforce page
 - What are the Disable X Trigger options in the Custom Settings?
 - I upgraded my adapter to v5, but I don't see the CTI Flows feature.
 - I upgraded my adapter from v3 to v5 and we lost some screenpop functionality.
 - The CCP doesn't show up in service console and I instead see the following image:
 - Certain picklists are missing picklist items.
 - I upgraded my adapter to v5.10, but I cannot see the CCP Config changes

Release Notes

Important: when upgrading the CTI Adapter, please make sure that the Salesforce Lambdas are also updated to the newest version. Also review the [CTI Adapter Installation Troubleshooting and Common Issues](#) section for known issues and troubleshooting.

5.13 April 2021

- **Feature: CTI Actions - programmable buttons within the CCP overlay**

In this release, we have added a feature called CTI Action which are programmable buttons for your CTI Flows. Each CTI Action is a button that can be programmed to trigger a CTI Flows whose source value is "CTI Action." In addition, CTI Actions can be programmed to ask the agent for additional information via a data entry form. You can use the agent's entry in your CTI Flow with the help of "Get Payload" block.

This is a great way to ask your agents to enter ad-hoc data prior to running the CTI Flow to provide additional information as part of a workflow to automate case creation, or start a customer refund process. **If you are upgrading from a previous version of the CTI Adapter, please be sure to review the additional setup steps required for CTI Actions.**

- **Feature: CTI Actions: recording API integration within the CCP overlay**

The CTI Adapter now includes integration with Connect's recording API. This feature allows the agent to control when to start and stop recording a call. Once the recording has started, they can also pause and resume it. For example, agents can pause a recording before asking for sensitive information from your customers. Once the agent stops a recording, you cannot start it again. Use pause/resume buttons after you've started recording a call to control the recording.

- **Enhancement: Voicemail Drops (beta)**

The **beta Voicemail Drops** feature now integrates with CTI Actions. In the beta, voicemail drops were loaded directly into the CCP Overlay. As of 5.13, you will need to create a CTI Action, and use the newly added "Leave a Voicemail" block in the CTI Flow where you can configure the specific voicemail drop and the quick connect name to use for the voicemail.

- **Feature: CCP Overlay: Data panel to receive data from CTI Flows.**

You can now send data from a CTI Flow to the CCP Overlay. The Data panel on CCP Overlay will display any object you pass it from "Send Data to CCP Overlay" block.

- **Feature: CTI Flow Blocks: "Start Recording" and "Stop Recording"**

With "Start Recording" and "Stop Recording" blocks, you can control the voice recording of the call within your CTI Flows.

- **Feature: CTI Flow Block: "Update Contact Attributes"**

You can now update contract attributes using CTI Flows. This block accepts a list of key-value pairs and assigns them to the currently active contact. It may come handy for passing Case id and other important information to the next agent when transferring a call.

- **Feature: CTI Flow Block: "Get Payload"**

The `payload` object contains the arguments passed to the CTI Flow. Now you will be able to use "Get Payload" block to reference a payload key as an input in other blocks on your CTI Flow.

- **Feature: CTI Flow Block: "Send Data to CCP Overlay"**

This block allows you to send data to your agent from a CTI flow. The agent will see this information in the CCP Overlay in a panel entitled "Data."

- **Feature: CTI Flow Block: "Leave a Voicemail"**

This block works with the beta Voicemail Drops feature. When you configure the voicemailDropName and quickConnectName, it will pass the contact to an IVR to leave a voicemail on the agent's behalf.

- **Feature: CTI Flow Block: "Get Salesforce Lead ID":** This block allows you to get a Salesforce lead by using a phone number.
- **Enhancement:** "Get Salesforce Contact Id" block now uses FIND syntax to search across multiple fields.
- **Enhancement:** For the `SetAgentStatusOnSessionEnd` attribute, you can now specify multiple values.
- **Enhancement:** When `SetAgentStatusOnSessionEnd` feature is enabled, you can now configure which state the agent should be shown as when they login with the `InitialAgentState` setting.
- **Enhancement:** When `SetAgentStatusOnSessionEnd` feature is enabled, you can now configure which the agent to logout when all tabs are closed by setting the Status to Logout.
- **Bugfix:** Addressed issue that caused CTI Flows to be run on every open Salesforce tab.
- **Bugfix:** Addressed an issue in "Get Salesforce Contact Id" block that caused the query to fail if the phone number was in E164 format.
- **Enhancement:** Added the `onDestroy` Event to certain CTI Flow Sources

5.12 March 2021

- **Feature:** Added custom setting which will allow customers to enable and disable non-essential triggers (They are disabled by default now). [More details in the troubleshooting section](#)
- **Bugfix:** Addressed additional trigger issue that prevented orgs with 200k+ CCA records from updating Case and Contact records.
- **Bugfix:** Addressed issue where AC Permission sets did not include the `CustomerEndpointAddress` field for the `ContactChannelAnalytics` object.
- **Bugfix:** Addressed issue where AC Permission sets did not include the `MedialessPopout` page.

5.11 March 2021

- **Bugfix:** Addressed trigger issue that prevented community and partner users from updating Contact and Case records.

5.10 February 2021

- **Feature:** *Contact Control Panel (CCP) Audio Device settings option.* Admins can toggle Phone type settings and the new [Audio Devices settings](#) for agents to see on their CCP. [Audio Device settings](#) allow the agents to choose audio devices for their speaker, microphone, and ringer.
- **Feature:** *Custom Ringtone for chat.* Admins can configure a custom ringtone for chat (separate from CCP) from the CTI Adapter configuration page.
- **Enhancement:** The Salesforce built-in Cross Site Request Forgery (CSRF) protection is enabled for Visualforce pages in the CTI Adapter package which improves organizational security to protect against cross site request forgeries.
- **Bugfix:** Decision blocks no longer requires both sockets to be connected.
- **Bugfix:** Click to Dial stopped working after first use until the agent refreshed the page.
- **Bugfix:** Error that prevented Contact Lens app resources from being hosted on a different domain than the Salesforce instance.
- **Bugfix:** Error that prevented Contact Lens app from displaying intermittently when Transcribe was enabled.
- **Bugfix:** Changed the logic for the IsContactTransfer CTI Flow Block which always returned true.
- **Bugfix:** Medialess popout not closing after Salesforce tabs are closed.
- **Bugfix:** Login window did not close automatically after logging into Connect.
- **Bugfix:** Unable to upgrade the package if the Case or Contact object contained encrypted fields.

5.9 December 2020

- **Feature:** Contact Lens Integration
- **Feature:** Tasks Integration - Added the Amazon Connect Task Contact as a source to CTI Flow in addition to Task specific events
- **Feature:** CTI Block - Is Task Contact? - Check if the contact is a task
- **Feature:** CTI Block - Create Task Contact - Creating a new task contact with certain inputs.
- **Feature:** CTI Block - Pop Task Contact's Reference Urls - Pop any reference urls that are related to the task contact
- Upgraded Salesforce API to v50.0.

- **Feature update:** If you have CCP open on multiple tabs, CTI Flows will be executed only on one of them. The execution will be performed on the current tab, by default. If the agent is currently looking at a different site, a random tab will be selected to perform the execution.
- **Enhancement:** \$User.ProfileId is now available through "userProfile" property.
- **Enhancement:** CTI Flow execution timeout window has been increased to 60 seconds.
- **Feature update:** When the CCP popout is opened, we now ask for a confirmation before refreshing or closing the tab that opened it. Note that if you do close the original tab, the pop out might also be closed.
- **Bugfix:** Voicemail Drops feature has been fixed.
- **Bugfix:** CTI Flow "Open Subtab" block has been fixed.

5.7 November 2020

- **Feature update:** Change audio recording feature in the Contact Channel Analytics page to use an audio streaming approach. Please review the updated [Contact Channel Analytics](#) section for the setup details.
- **Feature:** Add permission set specifically for the audio recording feature
- **Feature:** Localization into 9 languages.
- **Feature:** Add callType to return fields of "Get Contact Properties" block
- **Feature:** Add formatted phone number to return fields of "Get Contact Properties" block
- **Feature:** Add script name to CTI flow definition file.
- **Feature:** Remove context from log outputs
- **Bugfix:** Return field of "Open Primary Tab" was value, not id, as specified. We now provide it in both `value` and `id` fields for backward compatibility.
- **Feature:** Make the error message shown when the execution runs too long more informative.
- **Feature:** Make sure the attributes overlay doesn't open automatically when CCP is opened.
Documentation: "Create and pop that task" default flow is fixed.
- **Bugfix:** update return value of "Get Agent Configuration" block to match the documentation.
- **Feature:** Increase CTI Flow timeout to 10 seconds.
- **Bugfix:** remove the leading wildcard matcher in "Get Salesforce Contact Id" block query. The wildcard matcher caused performance issues with the query. Going forward make sure the phone number is an exact match to the one in file.
- **Bugfix:** Ensure "Join Strings" block does not ignore boolean false values.
- **Bugfix:** Ensure "Log to Console" block does not ignore boolean false values.
- **Feature:** Add uid field on top of the block on the canvas.
- **Bugfix:** Remove the loginWindow object from log output because it errors with "Cannot convert object to primitive value."

- **Bugfix:** ContactChannel object updates to new agent if previous agent rejected or missed a contact
- **Bugfix:** Changing status to logout now correctly logs agent out
- **Feature:** Rename "Enable Click to Dial?" to "Can Make Outbound Calls?".
- **Feature:** CTI Flow Block - math function - "Multiply"
- **Feature:** CTI Flow Block - math function - "Divide"
- **Feature:** CTI Flow Block - "Get Tab Object Map"
- **Feature:** CTI Flow Block - "Close Salesforce Tab"
- **Feature:** CTI Flow Block - "Delay"
- **Feature:** CTI Flow Block - "Get Primary Tab Ids"
- **Feature:** Improve browser log formatting.
- **Feature:** CTI Flow Block - "Get Tabs With Matching Url"
- **Feature:** *Update Connect agent status when all Salesforce tabs are closed:* You can set the agent status to a specific state if the SetAgentStatusOnSessionEnd feature is turned on and the agent's routing profile name includes the value of IfProfileNameIncludes setting, such as "On-Call." By default, the agent status is set to "Offline" if the feature is enabled and nothing is specified for IfProfileNameIncludes. If this feature is enabled, the agent will be automatically shown as available when they login to Salesforce and the CCP.
- **Feature:** CTI Flow Block - Length"
- **Feature:** CTI Flow Block - "Slice"
- **Feature:** CTI Flow Block - "Cast a Value to a Type"
- **Bugfix:** Agent is able to accept calls when Medialess is turned on.
- **Feature:** CTI Flow Block - "Get CCP Logs" Remove "Initialization" and "Browser" sources
- **Feature:** Allow users to specify Amazon Connect Instance url in CTI Adapter details in addition to Amazon Connect Instance Alias

5.5 October 2020

- **Feature:** CTI Flow Block - "Clear All Properties"
- **Feature:** CTI Flow Block - "Unset Property"
- **Feature:** CTI Flow Block - "Show All Attributes"
- **Bugfix:** Attributes panel can now display attributes of transferred contacts.

5.4 Late September 2020

- **Feature:** You can now provide additional ad-hoc fields to "Create a Task" block. (Note: the values of these fields don't have a lookup dropdown yet.)

- **Feature:** New CTI Block! - You can now create "counters" with the "Update Counter" and read the value of your counters using "Get Counter" block.
- **Feature:** You can now get the number of open tabs from `openAgentTabs` counter.
- **Feature:** You can now compare multiple things using "Is One Of?" block in CTI Flows.
- **Feature:** New CTI Block! - You can now extract a value from a complex value, such as an array or an object, using the "Extract Value" block. (This comes handy when you retrieve a Salesforce object.)
- **Feature:** New CTI Block! - You can use the Salesforce retrieve API to fetch a record from the server by id using "Retrieve Salesforce Record" block.
- **Feature:** New CTI Block! - You can use the "Get Salesforce Contact Id" to fetch the id of a Salesforce contact by its phone number.
- **Feature:** New CTI Block! - You can now show a window alert using "Alert" block.
- **Feature:** New CTI Block! - You can now use create a complex string using string templates and multiple variables with the help of "String Template" block.
- **Bugfix:** When a screenpop is "deferred," the CTI Block used to return an inexact match and the Id field in the return value of the block would be blank. This issue has been fixed in this release.
- **Bugfix:** Presence sync is working again. The current release also reduces the wait threshold between each presence sync update from 1 second to 100ms, i.e. co-occurring events won't get lost anymore (as much).
- **Bugfix:** The encoding issue affecting "SOQL Block" has been fixed. The single quotes in the SOQL query are no longer encoded as HTML entities.
- **Bugfix:** To access the return value of another block, power users use "magic strings," e.g. `\$.actions.<blockId>.results.<fieldName>`, but these strings used to be cleared in the UI when the block is selected on the canvas. This issue is now fixed.
- **Bugfix:** The spelling of `TaskSubtype` field in "Create a Task" block has been fixed. Your TaskSubtype won't get lost anymore.
- **Bugfix:** Call recording view for a Case has been fixed.
- **Bugfix:** "Is Contact Inbound?" block is working again.
- **Bugfix:** "Is Truthy?" block now works with boolean input values.
- **Bugfix:** Salesforce UI onNavigationChange event listener is working again.
- **Bugfix:** We now alert you to change your instance alias if you try to sign in with instance alias set to "default."

5.3 September 2020

- **Bugfix:** Fix the issue that caused ACSFCCP_CallRecordingTask component to not work.

5.1 Late August 2020

- **Bugfix:** Ensure "Get App View" CTI Flow block doesn't break the sidebar
- **Enhancement:** Add "queueARN" field to "Dial Number" CTI Flow block
- **Bugfix:** Ensure some required CTI Flow block fields are not shown as "optional"
- **Bugfix:** Ensure "Save (or Create) a Record" block works as expected
- **Bugfix:** Fix the validation error on "CallDurationInSeconds" field in "Create a Task" block
- **Bugfix:** Fix phantom scrollbar on Windows machines
- **Bugfix:** Fix issue where copying contact attributes to clipboard doesn't work
- **Bugfix:** Fix issue where "saveLog" CTI Flow block throws an error
- **Bugfix:** Fix issue with onOffline Flow event not firing
- **Bugfix:** Fix various omnichannel presence sync bugs
- **Bugfix:** Ensure the CCP default dimensions are adjusted to CCPv2 defaults
- **Feature:** Add block "Set Agent Status By Name on Connect."

5.0 August 2020

- **This release has new features and updates:** Please test and validate version 5.0 in your Salesforce sandbox before upgrading this in production.
- **CTI Flows:** CTI Flows replace Lightning CTI Extensions in allowing customers to build their agent for Lightning and Classic via a drag drop UI. Many of the CTI blocks are similar to the Lightning CTI Extension script API calls and can be mapped similarly. Lightning CTI Extension scripts are NOT automatically migrated to CTI Flows. When upgrading the with existing scripts, it will give you the option to download the existing script for reference before building your CTI Flows. We strongly recommend you validate this install/upgrade in a test environment and fully test the CTI Flows against your previous scripts functionality. Please open a support ticket if there is additional functionality you require from your current scripting implementation.
- **Security Profile improvements:** AC Administrator, AC Agent, and AC Manager permission sets to enforces objects access and fields level (FLS) as per Salesforce security guideline for managed package. To Amazon Connect Objects and fields, user should either one of Amazon Connect permission sets AC Administrator, AC Agent, and AC Manager.
- **Attributes:** Amazon Connect CCP (Contact Control Panel) in Lightning Classic now display an overlay for showing attributes consistently.
- **AWS Secrets Manager** support for storing Salesforce credentials.
- **VPC Support:** ability to place Lambdas in VPC
- **New Salesforce API integration:** Exposed new operations in sfinvokeapi read or create Salesforce records(query queryOne, createChatterPost, createChatterComment, lookup_all, delete)

- **Upgrade:** Amazon Connect Streams API bumped up to version 1.5.
- **Bugfix:** Task creation issue for non connect users - Fixed task trigger apex code, added a validation before security access check for Amazon managed package objects
- **Bugfix:** Contact interaction fixed.
- **Other minor bugfixes and improvements**

4.5 April 2020

- **This release has new features and updates:** Please test and validate version 4.5 in your Salesforce sandbox before upgrading this in production.
- **Installation / Configuration:** AC_Administrator permission set has been added to manage CTI Configuration in addition to AC_Manager and AC_Agent. See documentation for further information.
- **API:** Updated support for CCPv2 in Classic/Console. See documentation for Call Center settings.
- **Bugfix:** Updated attribute display to resolve duplicated attributes.
- **Security:** Improved control access at the object-level, the record-level, and at the field level.

4.4 March 2020

- **This release has significant new features and updates:** Please test and validate version 4.4 in your Salesforce sandbox before upgrading this in production.
- **Documentation:** Guide has been rewritten and restructured based on feedback.
- **Installation / Configuration:** Improved installation and configuration guide
- **Installation / Configuration:** Added Enhanced Agent Logout functionality to Lightning.
- **API:** Updated to the latest Amazon Connect Streams and Chat libraries
- **API:** Additional extensibility methods provided
- **Setup:** Improved Presence Sync Rule editor
- **Setup:** CTI Adapter validation is performed upon initialization and will inform the user of common misconfigurations.
- **Setup:** Additional CTI Script examples are provided.
- **Setup:** The ability to place the lightning transcript view on Task, Contact Channel, and Contact Channel Analytics object has been added.
- **Bugfix:** Updated allowlisting steps to address login popup issue.
- **Bugfix:** OmniChannel workload data not being usable has been resolved
- **Bugfix:** CTI Attribute issue when processing multiple pieces of contact attribute data has been resolved.
- **Bugfix:** The call transcript now scrolls within a fixed region rather than consuming vertical space.

- **Bugfix:** Finding Task Record in Classic/Console fixed.
- **Security:** The ability to create, update, and delete AC_CtiAdapter, AC_CtiScript, AC_CtiAttribute and AC_PresenceSyncRule records has been removed from the AC_Agent permission set.

4.2 December 2019

- **This release has significant new features and updates:** Please test and validate version 4.2 in your Salesforce sandbox before upgrading this in production.
- **Installation / Configuration:** Improved installation and configuration guide
- **API:** Lightning CCP Extension scripts and reference guide
- **Setup:** A default CTI adapter and scripts for click-to-dial, voice contact pop, and chat contact pop are not included in the base installation.
- **Editor:** A more robust script editor is included for use in CTI adapter / script configuration.
- **Bugfix:** SSO issue has been resolved

4.1 November 2019

- **This release has significant new features and updates:** Please test and validate version 4.1 in your Salesforce sandbox before upgrading this in production. As we look to simplify documentation, this release introduces a new [Amazon Connect CTI Adapter v4 for Salesforce Lightning](#) setup and installation guide. Please review this setup guide in detail to see all the latest changes for Lightning CTI Adapter installations.
- **Classic and Console CTI setup guide:** Please use the [Amazon Connect CTI Adapter v4 for Salesforce Classic](#) setup and installation guide for Classic and Console CTI Adapter installations.
- **Amazon Connect Chat and Contact Control Panel (CCP) v2:** support for Amazon Connect chat and integration of CCP v2. CCP v2 is required for Lightning CTI Adapter installations. CCP v1 is still supported for Classic / Console CTI Adapter installations.
- **Historical and Real-Time Reporting:** updated historical metric functionality with additional metrics and dashboards. Added real-time metrics and dashboards. This functionality requires an update of AWS Serverless Lambda functions for Salesforce.
- **Lightning CCP Extensions and configuration:** We have revamped the approach for the Call Center config and have added a new AC CTI Adapters Lighting config page.
- **High Velocity Sales:** CTI Adapter integration supported for Salesforce High Velocity Sales product.

Key Benefits and Requirements

The key benefits of the Amazon Connect CTI Adapter are:

- **Amazon Connect Voice and Chat:** ability to take voice and chat calls in the salesforce agent experience and advanced screen pop on the incoming phone number, case, account or contact. Agents can also click to dial a number within their contacts.
- **Single Sign-On support:** seamless login with Connect and Salesforce with any standard SAML 2.0 provider.
- **Call disposition and activity management:** configure post call workflows to support your Agent's after call work.
- **Call logging and recording:** Voice and chat interactions can be logged as Salesforce activities and Amazon Connect call recordings can be played within the Salesforce.
- **Omnichannel Presence Sync:** enable Salesforce chat, sms and email to share presence with Amazon Connect. Amazon Connect will know when an agent is handling a Salesforce chat and make them unavailable for a voice call, and vice versa.
- **CTI Flows:** easily customize and extend behaviors within the CTI Adapter such as screenpop and activity management. Default flows along with the API guide provide key examples.
- **High-velocity sales (HVS):** using Salesforce HVS, enable your inside sales team to follow a repeatable pre-define sales cadence for your business. It enables sales managers and reps to work on prioritize list of prospects and follow best sequence of sales outreach activities defined by your sales process.

The key benefits of the AWS Serverless Application Repository for Salesforce are:

- **Access Salesforce Data:** easily inject salesforce data into the customer experience. Businesses can offer personalized greetings and dynamic routing based on customer information, create new objects, update existing records, and delete items based on customer choices in the IVR.
- **Contact center real-time reports:** display real-time contact center metrics within Salesforce from Amazon Connect.
- **Contact center historical reports:** display historical contact center metrics within Salesforce from Amazon Connect.
- **Contact analytics:** transcribe voice calls and perform analysis of the conversations using AI to surface sentiment, keywords, syntax, entities, etc.

We recommend that you initially install and configure the package into your Salesforce sandbox. This will allow you to test the integration, become more familiar with it, and modify it to your needs prior to deploying it to your production org.

If you are using Lighting, you can get a head start by working through the [Build an Amazon Connect Integration Salesforce Trailhead](#).

Requirements

To successfully deploy, configure, and implement the Amazon Connect integration with Salesforce, you must ensure that the following requirements and prerequisites are in place before.

Prerequisites - Amazon Connect CTI Adapter

In order to successfully install and configure the Amazon Connect CTI Adapter from the AppExchange you will need:

1. Salesforce
 - a. Salesforce org with Lightning experience
 - b. My Domain configured and deployed to users
2. An Amazon Connect instance
3. SAML Details (If using SAML)

Prerequisites - AWS Serverless Application Repository for Salesforce

In order to successfully install and configure the Salesforce functions from the Serverless Application Repository, you will also need:

1. A Kinesis stream configured for your Amazon Connect contact trace records (CTRs)
2. Salesforce:
 - a. An API user account
 - b. A new Connected App

Browser Compatibility

Amazon Connect requires WebRTC to enable soft-phone voice media stream and Websockets to enable soft-phone signaling. Consequently, users are required to use the latest version of either Google Chrome or Mozilla Firefox. For more information, please see the [Amazon Connect documentation](#).

Salesforce Lightning Support

Please note that following features are currently not supported in Salesforce Lightning:

- Outbound Campaign Calls using Salesforce Omni can be routed to the agent, but the automated screen pops and the dialing of the phone number will not work. The agent will have to click on the record links to open the records and use Salesforce's Click-to-Dial feature to make the phone call.
- Lightning Standard Navigation is not currently supported in App Options for the Amazon Connect CTI Adapter.

Installing CTI Adapter Managed Package from AppExchange

The Amazon Connect CTI Adapter for Salesforce provides the core integration between the two platforms. It embeds the Amazon Connect Contact Control Panel into Salesforce which provides telephony control as well as access to event data coming from Amazon Connect. Using this adapter, you can configure screen pops based on customer data, automate contact center telephony functions like click-to-dial, and establish presence syncing rules for integration with Salesforce Omni-Channel. This is the base of the integration.

Installing the Package

The first step in the deployment of the integration is to install the Amazon Connect CTI Adapter managed package from the AppExchange Marketplace.

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find**, type **AppExchange** (the results will populate without hitting enter)
3. Select **AppExchange Marketplace** from the links provided
4. In the AppExchange window, enter **Amazon Connect** into the **Search AppExchange** field and press enter
5. In the **Search Results**, select **Amazon Connect CTI Adapter**

[◀ BACK](#)

Search Results for "Amazon Connect"

48 Apps · Sorted by Relevance

6. On the Amazon Connect CTI Adapter detail page, select **Get It Now**

This screenshot shows the product detail page for the 'Amazon Connect CTI Adapter'. The top navigation bar includes a back link, the product name, and the developer information 'by Amazon Web Services'. The left sidebar shows tabs for 'DETAILS' (which is selected), 'REVIEWS', and 'PROVIDER'. The main content area features a video thumbnail showing a man speaking, with the caption 'Amazon Connect CTI Adapter for Salesforce Overview and Demo'. Below the video are sections for 'Highlights' and 'Contact Information'. A prominent blue button at the bottom right is labeled 'Get It Now'.

7. If you are presented with the Log In to AppExchange screen, select **Open Login Screen**. You should then be presented with an Allow Access Screen. Choose **Allow**

8. On the **Where do you want to install Amazon Connect CTI Adapter** page, choose the **Install Here** button in the **Install in This Org** section

Where do you want to install Amazon Connect CTI Adapter: CTI | Contact Center | IVR | ACD | Call Recording?

Before you install in a production org, we recommend testing in a sandbox first.

Install in This Org

11. The CTI Adapter will take some time to install. While it installs, you will be presented with the **This app is taking a long time to install** screen.

12. Choose **Done**.

aws Install Amazon Connect CTI Adapter: CTI | Contact Center | IVR | ACD | Call Recording

By Amazon Web Services

This app is taking a long time to install.

You will receive an email after the installation has completed.

Done

13. Once you receive confirmation that the **installation has completed** via email, return to the browser

14. Close the **Amazon Connect CTI Adapter** detail page (if still open)

15. In Quick Find, enter **Installed**, then select Installed Packages from the result

16. Once the **Installed Packages** page opens, validate that the **Amazon Connect -- Universal Package** is installed

Set Access Permissions

All users must be assigned the required permission set to access Salesforce metadata. The Amazon Connect CTI Adapter includes two Permission Sets, one for agents and one for managers, that grant users the appropriate access for their role. More information on assigning user permissions can be found in the [Salesforce help documentation](#).

1. Log in into your Salesforce org and go to **Setup**

2. In **Quick Find**, enter **Permission** and select **Permission Sets** from the results

3. Choose **AC_Administrator**, **AC_Agent** or **AC_Manager** as appropriate for the user(s)

Permission Sets

On this page you can create, view, and manage permission sets.

In addition, you can use the Salesforce mobile app to assign permission sets to a user. Download SalesforceA from the App Store or Google Play: [iOS](#) | [Android](#)

Configure the Lightning Experience

In this guide, we will configure the CTI Adapter for Service Console (Lightning Experience). You may use the same procedure described in this section for other applications.

Configure Service Console

First, you need to add the CTI softphone to your Service Console.

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** box, type **App Manager**, then choose **App Manager** from the result list.

App Manager

▼ Apps

App Manager

Didn't find what you're looking for?

Try using Global Search.

3. Expand the drop-down menu associated to Service Console and select **Edit**.

6. Change the Label, if desired, then choose **Save**.

Allowlist Your Salesforce Org with Amazon Connect

In order to embed the Amazon Connect Contact Control Panel (CCP) into your Service Console, you need to allowlist two (2) domains for your org with Amazon Connect. This allows for cross domain access to the underlying resources required for the CCP to function.

1. Log in into your Salesforce org and go to **Setup**

2. Copy the entire URL of this page and past it to a text document.

3. In the **Quick Find** field, type **visual**, then select **Visual Force Pages** from the results

Q visual||

Custom Code

5. On the Visualforce detail page, select the Preview button. This will open a new browser tab showing the page content, which should only be a button labelled Sign in to CCP. Copy the entire URL of this page and past it to a text document.

6. In a new browser tab, login to the AWS console

7. Navigate to the Amazon Connect Console

8. Validate that you are in the correct AWS region for your instance, then select your instance alias from the list of instances

Amazon Connect virtual contact center instances

Select a virtual contact center instance to manage its directory, administrator(s), telephony options, data storage, and advanced features.

| Add an Instance | Remove | | | |
|---|-------------------------------|-----------------------------|-------------|--------|
| Instance Alias | Access URL | Channels | Create Date | Status |
| <input type="checkbox"/> stsetestconsolidated | https://[REDACTED].awsapps... | Inbound, outbound telephony | 1/21/2020 | Active |

9. Choose Application Integration from the left navigation

10. Select + Add origin

11. In the Enter origin URL field, enter the URL of the page that you copied in step 2. Only enter the url through the .com, for example:

<https://XXXXXXXXX-dev-ed-.lightning.force.com>

12. Select Add. You should see your org domain listed in the Approved origins section.

Approved origins

Once you integrated with a CRM product, add the origins (scheme + host + port) that Amazon Connect will need to have access to.

<https://XXXXXXXXX-dev-ed.lightning.force.com>

[remove](#)

13. Select + Add origin

14. In the Enter origin URL field, enter the URL of the visualforce page that you copied in step 5. Only enter the url through the .com, for example:

<https://XXXXXXXXX-dev-ed--amazonconnect.visualforce.com>

15. Select Add. You should see your org domain listed in the Approved origins section

Approved origins

Once you integrated with a CRM product, add the origins (scheme + host + port) that Amazon Connect will need to have access to.

<https://XXXXXXXXX-dev-ed--amazonconnect.visualforce.com>

[remove](#)

Modify the Call Center

Now that you have allowlisted the org in the Amazon Connect Console, you will need to modify the Call Center that was configured in Salesforce when the AppExchange package was installed. Once you complete the configuration, you add users to the Call Center to provide access to it.

1. Log in into your Salesforce org and go to **Setup**

2. In the **Quick Find** field, enter **Call Center**, then select **Call Centers** from the result list

▼ Feature Settings

 ▼ Service

 ▼ Call Center

[Call Centers](#)

 Directory Numbers

 Softphone Layouts

3. If you see the **Say Hello to Salesforce Call Center** page, select **Continue**

4. Select AC Lightning Adapter

All Call Centers

A call center corresponds to a single computer-telephony integration (CTI) system already in place. You can manage Call Center features.

| Action | Name ↑ |
|------------|---|
| Edit Del | AC Lightning Adapter |
| Edit Del | Amazon Connect CCP Adapter Classic 3.11 |
| Edit Del | Amazon Connect CCP Adapter Console 3.11 |

5. On the **AC Lightning Adapter** detail page, select **Edit**

6. Replace the **CTI Adapter URL** with the AC Lightning Adapter visualforce page url you copied in the previous section.

7. Next, change the values for **Softphone Height to 570** and the **Softphone Width to 330**, and choose **Save**.

8. Once you return to the AC Lightning Adapter detail page, choose **Manage Call Center Users** in the Call Center Users section

9. On the **AC Lightning Adapter: Manage Users** page, select **Add More Users**.

10. Set filters (if desired) and then choose **Find**.

11. Select the checkbox next to the user to add, then choose **Add to Call Center**.

| | | | Add to Call Center | Cancel |

Edit Toolkit for Amazon Connect

Toolkit for Amazon Connect Information

Location

Url 

You will also see the option to enable and disable certain triggers in the package, which you can configure to meet your needs. You can change these whenever you would like to. For more details, see the troubleshooting section.

5. Select **Save**

Create the Softphone Layout

Next, we need to create a softphone layout for the solution. The softphone layout settings will tell the console what resources are available for screenpop by default and what to do under different match conditions.

1. Log in into your Salesforce org and go to **Setup**
 2. In the **Quick Find** box, type **Softphone**, then choose **Softphone Layouts** from the results
 3. If you are presented with the Get Started message, choose **Continue**
 4. On the Softphone Layouts page, choose **New**

Softphone Layouts

A softphone is a customizable call control tool that appears in the sidebar of every salesforce.com page if a user is assigned to a call center and is working on a machine on which a CTI adapter has been installed. Similar to page layouts, you can design custom softphone layouts and assign them to call center users based on their user profile.

5. Enter a name for the layout, such as **AmazonConnectDefault**, then select the **Is Default Layout** checkbox.

Softphone Layout Edit

Each softphone layout allows you to customize the appearance of a softphone for inbound, outbound, or self-service page.

The screenshot shows a software interface for editing a softphone layout. At the top, there are 'Save' and 'Cancel' buttons. Below them, a 'Name' field contains the value 'AmazonConnectDefault'. To the right of the name is a checked checkbox labeled 'Is Default Layout'. Both the 'Name' field and the checkbox are highlighted with a red rectangular border.

6. Expand **Display these salesforce.com objects** and select objects that CTI Connector should be able to search, for a screen-pop query. In this example, Case has been added to the default selection, allowing search and screen-pop by CaseID.

The screenshot shows a configuration interface for selecting objects. On the left, under 'Available' objects, a list includes 'AC Agent Performance', 'AC Contact Channel', 'AC Contact Channel Analytics', 'AC Contact Trace Record', 'AC CTI Adapter', 'AC CTI Attribute', 'AC CTI Script', 'AC Event', 'AC Historical Queue Metrics', 'AC Phone Call', 'AC Presence Sync Rule', 'AC QueueMatrix', 'AC Queue Metric Event', and 'AC Real Time Queue Metric'. An arrow points from the 'Available' list to the 'Selections' list. On the right, under 'Selections', objects like 'Account', 'Contact', 'Lead', and 'Case' are listed. The 'Case' object is highlighted with a red rectangular border. Below the lists are 'Add' and 'Remove' buttons, and 'Up' and 'Down' arrows for reordering.

7. If desired, configure the search behavior to your requirements

The screenshot shows a list of search behavior configurations. Each item has a 'Edit' link to its right. The items are:

- If single Account found, display: Account Name
If multiple matches are found, only the Account Name is displayed in Salesforce Classic. In Lightning Experience, all the selected fields are displayed.
- If single Contact found, display: Name
If multiple matches are found, only the Name is displayed in Salesforce Classic. In Lightning Experience, all the selected fields are displayed.
- If single Lead found, display: Name
If multiple matches are found, only the Name is displayed in Salesforce Classic. In Lightning Experience, all the selected fields are displayed.
- If single Case found, display: Case Number
If multiple matches are found, only the Case Number is displayed in Salesforce Classic. In Lightning Experience, all the selected fields are displayed.

8. Additionally, validate the Screen Pop settings. Please note that the default behavior is to not pop a screen if there is more than one result

The screenshot shows the 'Screen Pop Settings' configuration screen. It includes a 'Help about this section' link and a 'Collapse' link. The settings are organized into sections:

- Screen pops open within:** Existing browser window (Edit link)
- No matching records:** Don't pop any screen (Edit link)
- Single-matching record:** Pop detail page (Edit link)
- Multiple-matching records:** Pop to search page (Edit link, currently expanded)
 - Options: 'Don't pop any screen' (radio button), 'Pop to search page' (radio button, selected), 'Pop to Visualforce page' (radio button) with a text input field containing 'CaseSearch', and 'Pop to flow' (radio button) with a dropdown menu showing '--None--'.

9. Once you have configured the search behavior, choose **Save**

Initial CTI Adapter Configuration

Once we have setup the Call Center, we need to do a final configuration of the CTI Adapter before we can test the basic configuration. This will tie the Lightning CTI adapter settings to the Call Center.

Add the CTI Adapter Console App

1. Log in into your Salesforce org and go to the **Service Console**
2. Expand the **navigation menu** by selecting the down arrow and choose **Edit**.

3. On the Edit Service Console App Navigation Items page, select **Add More Items**

Edit Service Console App Navigation Items

Personalize your nav bar for this app. Reorder items, and rename or remove items you've added.

[Learn More](#) ⓘ

| NAVIGATION ITEMS (7) | Add More Items |
|----------------------|---|
| AC CTI Adapters | <input type="button" value="Add 1 Nav Item"/> |

4. Select the **+** next to **AC CTI Adapters** and select the **Add 1 Nav Item** button

Add Items

LIST VIEWS

Recently Viewed (Pinned list)

8. If no ACLightningAdapter entry exists, then select the new button to configure your AC CTI adapters, otherwise select the **ACLightningAdapter**

9. Fill out or confirm the Details as follows:

10. CTI Adapter Name: **ACLightningAdapter**

11. Amazon Connect Instance: The url of your Amazon Connect Instance. You can find this in the Amazon Connect Console as shown below (remove everything after ".com"):

The screenshot shows the 'Overview' section of the Amazon Connect console. On the left, there's a sidebar with links: Overview, Telephony, Data storage, Data streaming, Application integration, and Contact flows. The main area has a heading 'Overview' and several fields: 'Instance ARN' (redacted), 'Directory' (redacted), 'Service-linked role' (redacted) with a 'Learn more' link, 'Login URL' (https://[REDACTED].awsapps.com/connect/login), and 'Emergency access' with a warning message about giving full permission and a link to log in for emergency access.

12. Amazon Connect Instance Region: This is the region that your Amazon Connect instance is deployed in. For this field, you will enter the region code. For example, if you have deployed your Amazon Connect instance in US East (N. Virginia), you would enter us-east-1. For a list of region codes, please refer to the [AWS Service Endpoints](#) reference

13. Call Center Definition Name: **ACLightningAdapter** **Note:** This is the value of the Internal Name in the call center in the Call Center definition

14. Leave all other settings at the default for now, and choose Save

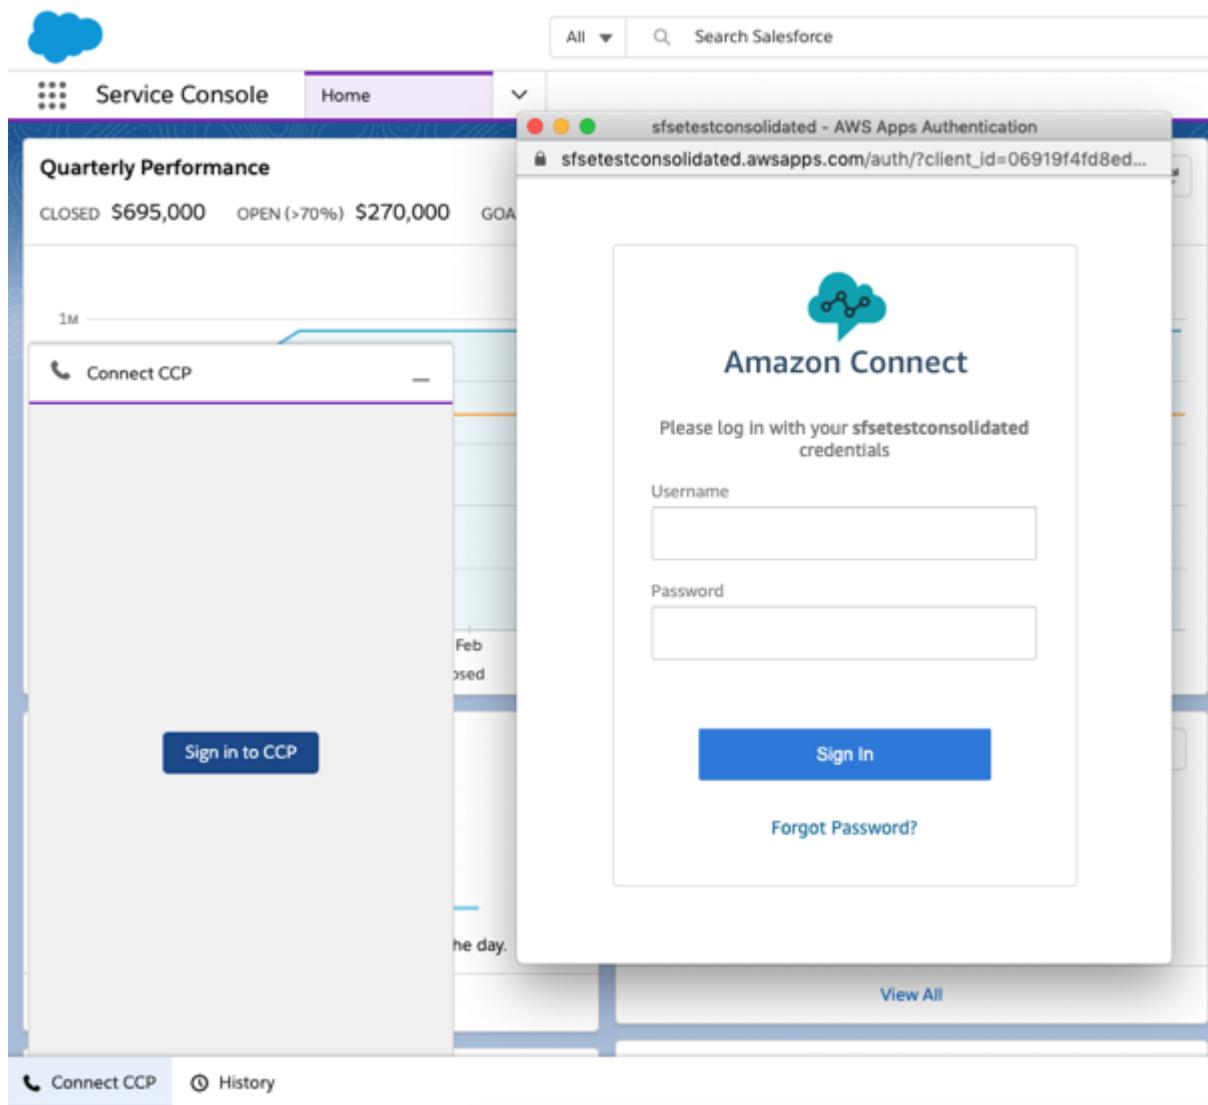

The screenshot shows the 'AC CTI Adapter' configuration page. At the top, it says 'AC CTI Adapter' and 'ACLightningAdapter'. Below that is a 'Details' tab. The configuration includes: 'ACLightningAdapter' (Internal Name), 'Amazon Connect Instance' (https://[REDACTED].awsapps.com/), 'Custom Ringtone' (checkbox checked), 'Softphone Popout Enabled' (checkbox checked), 'Medialess' (checkbox unchecked). On the right, there are sections for 'Owner' (redacted), 'Amazon Connect Instance Region' (us-east-1), 'Call Center Definition Name' (ACLightningAdapter), 'Debug Level' (Off), and 'Presence Sync Enabled' (checkbox checked).

15. Refresh the browser

16. In the bottom left corner of the Service Console, select the CTI Softphone icon

17. Select the **Sign in to CCP** button. A new window will pop up. Enter your Amazon Connect login credentials and select **Sign In**. Make sure to allow Microphone access (if asked by browser) **NOTE:** At this point, this process will only work for Amazon Connect instances configured for local user storage. If you are configuring SAML, please follow the SAML setup process in the [Single Sign On Settings](#) section before continuing.

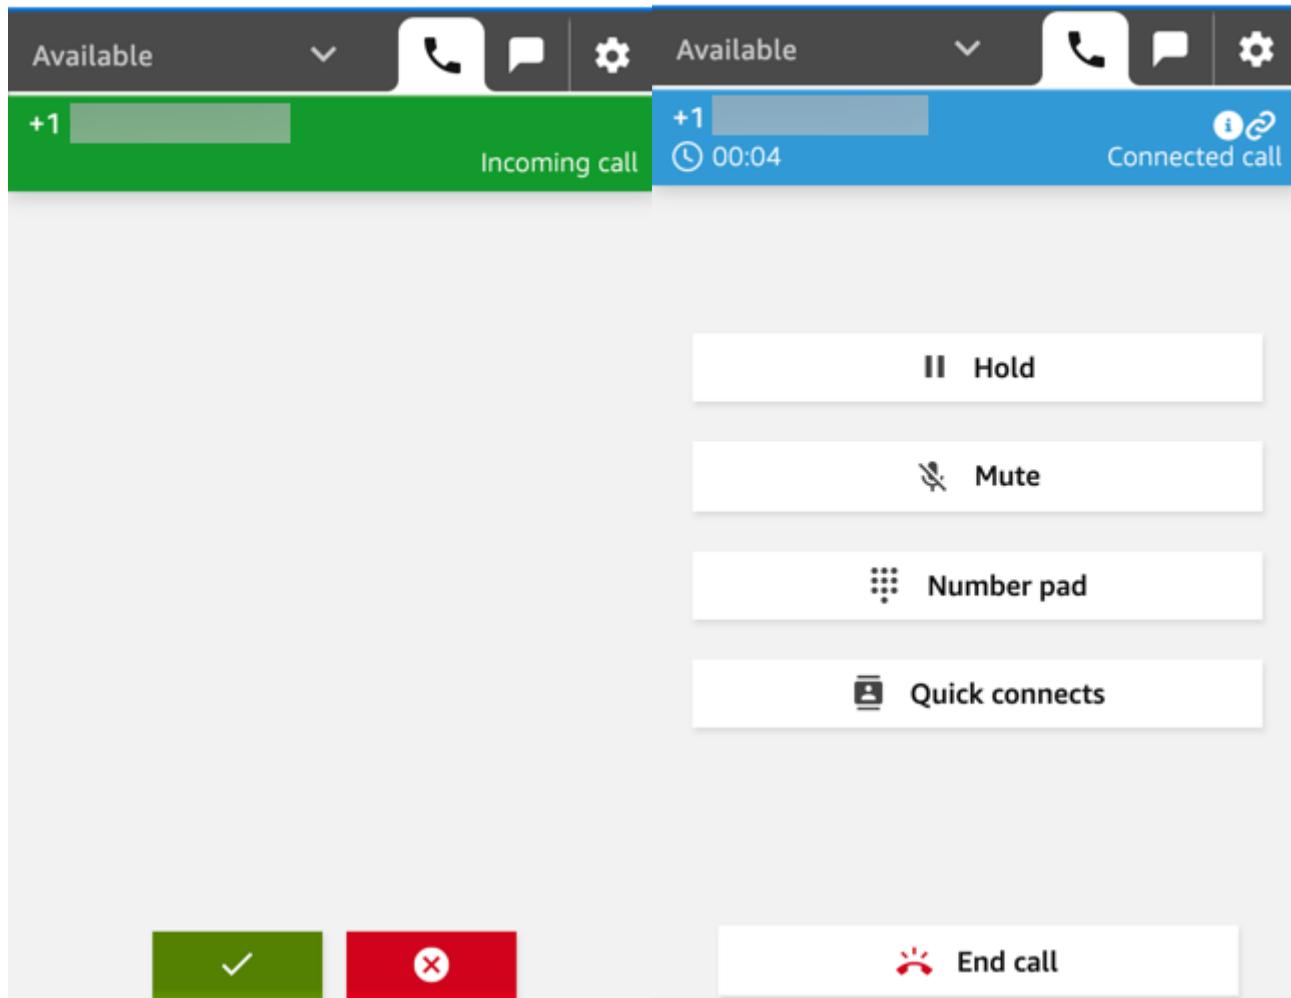

18. Once Login is successful, the pop-up window will automatically close.

19. Expand the status menu and choose Available

20. Make an inbound phone call to your Amazon Connect instance. The CCP will alert you to the incoming call and allow you to accept it. Once you do, the call will be connected

21. **End the call** and clear the contact

22. Set your agent back to **Available**

Enhanced Agent Logout

You can configure an agent status within "Manage agent status" with "Logout" (case-sensitive) in the status name to enable enhanced agent logout. When the agent selects that logout status in the Contact Control Panel, it will first set the agent in an offline status. It will then logout the agent in Connect and the AWS Console. Here is an example of the agent status configured within Connect:

Manage agent status

Create new agent status, and drag table rows to specify the order these statuses appear in the Contact Control Panel (CCP). To maintain integrity of historical metrics, agent status cannot be deleted. However, they can be disabled so that they no longer show in the CCP.

| Status name | Description | Type | Enabled for use in CCP |
|------------------------|---|----------|-------------------------------------|
| Unavailable Salesforce | Unavailable Salesforce | Custom | <input checked="" type="checkbox"/> |
| Break | Break | Custom | <input checked="" type="checkbox"/> |
| Lunch | Lunch | Custom | <input checked="" type="checkbox"/> |
| Available | Available state | Routable | <input checked="" type="checkbox"/> |
| Offline | Offline state | Offline | <input checked="" type="checkbox"/> |
| Logout | Sets the Connect user to offline and then completes logs out the Connect user | Custom | <input checked="" type="checkbox"/> |

Save Cancel

Here is an example of an agent selecting the "Logout" status within the Contact Control Panel:

Validate Basic Screenpop

Next, we will add a contact to Salesforce that has your phone number assigned to it. This will allow us to validate the basic screenpop functionality that is provided with the CTI adapter.

1. Select **Contacts** from the dropdown menu

4. Select **Save**

5. Close the Contact tab by selecting the X next to the name of the contact that you just created

6. Refresh your browser

7. Place another phone call into your instance

8. The new contact should automatically pop-up as it has been recognized by incoming phone number.

Installing the Amazon Connect Salesforce Lambda Package

The Amazon Connect Salesforce Lambda package adds considerable capability to the integration. It includes data connectivity between Amazon Connect and Salesforce for typical tasks like lookups, case creation, and updates. Additionally, it adds new features like real-time and historical data imports, contact trace record imports, recording import, transcription, and contact analytics functions. These capabilities are configurable and can be activated or deactivated on a call-by-call basis.

The Amazon Connect Salesforce Lambda package is delivered via the AWS Serverless Application Repository. The AWS Serverless Application Repository enables you to quickly deploy code samples, components, and complete applications. Each application is packaged with an AWS Serverless Application Model (SAM) template that defines the AWS resources used. There is no additional charge to use the Serverless Application Repository - you only pay for the AWS resources used in the applications you deploy.

Prerequisite Configuration and Data Collection

In order to successfully deploy and utilize the functions in the Amazon Connect Salesforce Lambda package, you will need to validate and configure some items in your Salesforce Org and gather some information from your Amazon Connect instance.

- Check your Salesforce API version
- Create a new Connected App
- Create a new API user

- Gather Amazon Connect information

As you are preparing to deploy the package, it is a good idea to open a text editor and note information as you configure the environment. We will point out the items you will need to provide.

Check your Salesforce API Version

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** field, type **apex**, then select **Apex Classes** from the results

The screenshot shows the Salesforce Setup search interface. A search bar at the top contains the text "apex". Below the search bar, a list of results is displayed. The first result, "Apex Exception Email", is shown in a collapsed state with a triangle icon. The second result, "Apex Classes", is shown in an expanded state with a list of sub-options: "Apex Settings", "Apex Test Execution", "Apex Test History", and "Apex Triggers". The "Apex Classes" option is highlighted with a red rectangular box.

3. Select New

The screenshot shows the Apex Class creation page. At the top, there are several buttons: "Developer Console", "New" (which is highlighted with a red rectangular box), "Generate from WSDL", "Run All Tests", and "Schedule Apex". Below these buttons is a table header with columns: Action, Name ↑, Namespace Prefix, Api Version, Status, Size Without Comments, Last Modified By, and Has Trace Flags. The "Name ↑" column is currently sorted in ascending order.

4. Select the Version Settings tab

Apex Class

The screenshot shows the Apex Class Edit page. At the top, there are three buttons: "Save", "Quick Save", and "Cancel". Below these buttons is a navigation bar with tabs: "Apex Class" and "Version Settings" (which is highlighted with a red rectangular box). The main content area shows a toolbar with icons for search, refresh, and text styling, followed by a text editor containing the number "1".

5. Note the Salesforce.com API version in your notepad

Apex Class

Apex Class Edit

Save Quick Save Cancel

Apex Class Version Settings

| Name | Version |
|------------------------------------|---------|
| Salesforce.com API | 47.0 |
| Amazon Connect - Universal Package | 4.2 |

Create a New Connected App

To leverage the full potential of the integration, Salesforce data needs to be accessed from AWS environment. The package comes with a set of pre-built AWS Lambda functions to lookup, update and create Salesforce objects within Amazon Connect Contact Flows. These Lambda function access Salesforce using the Salesforce REST API.

To get access to the environment, a Connected App must be configured with OAuth settings enabled.

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** field, type **app manager**, then select **App Manager** from the results
3. In the upper right corner, select **New Connected App**

4. On the New Connected App form, enter a name for the Connected App, such as **Amazon Connect Integration** and press tab. This will populate the API Name automatically. Then provide a contact email address

New Connected App

Basic Information

| | |
|--------------------|----------------------------|
| Connected App Name | Amazon Connect Integration |
| API Name | Amazon_Connect_Integration |
| Contact Email | dougjaso@amazon.com |

5. Select the checkbox to **Enable OAuth Settings**

▼ API (Enable OAuth Settings)

Enable OAuth Settings

6. Set the **Callback URL** to <https://www.salesforce.com>

API (Enable OAuth Settings)

Enable OAuth Settings

Enable for Device Flow

Callback URL <https://www.salesforce.com>

7. In the Selected OAuth Scopes section, select the following and add them to the Selected OAuth Scopes:

8. Access and manage your data (api)

9. Access your basic information (id, profile, email, address, phone)

10. Select the checkbox for Require Secret for Web Server Flow

11. The **API (Enable OAuth Settings)** section should now look like this

API (Enable OAuth Settings)

| Enable OAuth Settings | <input checked="" type="checkbox"/> | | | | |
|---|--|------------------------|-----------------------|---|---|
| Enable for Device Flow | <input type="checkbox"/> | | | | |
| Callback URL | <input type="text" value="https://www.salesforce.com"/> | | | | |
| Use digital signatures | <input type="checkbox"/> | | | | |
| Selected OAuth Scopes | <table border="1"> <thead> <tr> <th>Available OAuth Scopes</th> <th>Selected OAuth Scopes</th> </tr> </thead> <tbody> <tr> <td> Access and manage your Chatter data (chatter_api) Access and manage your Eclair data (eclair_api) Access and manage your Wave data (wave_api) Access custom permissions (custom_permissions) Allow access to your unique identifier (openid) Full access (full) Perform requests on your behalf at any time (refresh_token, offline_access) Provide access to custom applications (visualforce) Provide access to your data via the Web (web) </td> <td> Access and manage your data (api) Access your basic information (id, profile, email, address, phone) </td> </tr> </tbody> </table> | Available OAuth Scopes | Selected OAuth Scopes | Access and manage your Chatter data (chatter_api) Access and manage your Eclair data (eclair_api) Access and manage your Wave data (wave_api) Access custom permissions (custom_permissions) Allow access to your unique identifier (openid) Full access (full) Perform requests on your behalf at any time (refresh_token, offline_access) Provide access to custom applications (visualforce) Provide access to your data via the Web (web) | Access and manage your data (api) Access your basic information (id, profile, email, address, phone) |
| Available OAuth Scopes | Selected OAuth Scopes | | | | |
| Access and manage your Chatter data (chatter_api) Access and manage your Eclair data (eclair_api) Access and manage your Wave data (wave_api) Access custom permissions (custom_permissions) Allow access to your unique identifier (openid) Full access (full) Perform requests on your behalf at any time (refresh_token, offline_access) Provide access to custom applications (visualforce) Provide access to your data via the Web (web) | Access and manage your data (api) Access your basic information (id, profile, email, address, phone) | | | | |
| Require Secret for Web Server Flow | <input checked="" type="checkbox"/> | | | | |
| Introspect All Tokens | <input type="checkbox"/> | | | | |
| Configure ID Token | <input type="checkbox"/> | | | | |
| Enable Asset Tokens | <input type="checkbox"/> | | | | |
| Enable Single Logout | <input type="checkbox"/> | | | | |

12. Select **Save** at the bottom of the screen.

13. Select **Continue** on the New Connected App page

14. You should now be at the new app's page

15. Copy the value for **Consumer Key** to your notepad

16. Select **Click to reveal** next to Consumer Secret and copy the value to your notepad

17. At the top of the detail page, select **Manage**

18. On the Connected App Detail page, select the **Edit Policies** button

19. Set Permitted Users to **Admin approved users are pre-authorized** and choose OK on the pop-up dialog

20. Set IP Relaxation to **Relax IP restrictions**

21. The OAuth Policies section should now look like the following

OAuth Policies

| | | | |
|----------------------|--|-----------------------|---|
| Permitted Users | <input type="text" value="Admin approved users are pre-authorized"/> | IP Relaxation | <input type="text" value="Relax IP restrictions"/> |
| Enable Single Logout | <input type="checkbox"/> | Refresh Token Policy: | <input type="text" value="Immediately expire refresh token"/> |

22. Select **Save**

Create a new API user

The Lambda functions authenticate with Salesforce via user credentials. It is a common practice to create an API user account for this purpose.

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** field, type **profiles**, then select **Profiles** from the results
3. Select New Profile

The screenshot shows the 'Profiles' page in the Salesforce Setup. At the top left is a blue square icon with a white person symbol. To its right is the word 'SETUP'. Below that is the word 'Profiles'. Underneath is a large section titled 'Profiles' with a sub-section title 'All Profiles'. Below this are three buttons: 'Edit | Delete | Create New View', 'New Profile' (which is highlighted with a red box), and a refresh icon.

4. Provide a Profile Name, such as **API_ONLY**
5. From the **Existing Profile** dropdown, select **System Administrator** **NOTE:** You're advised to use a full Salesforce License for the user to be able to set the below permissions and have full access to avoid any other errors.

Clone Profile

Enter the name of the new profile.

You must select an existing profile to clone from.

| | |
|------------------|----------------------|
| Existing Profile | System Administrator |
| User License | Salesforce |
| Profile Name | API_ONLY |

Save Cancel

6. Select **Save** to create the new profile
7. Once the new profile page opens, select the **Edit** button
8. Scroll down to the Administrative Permissions section
9. If the Lightning Experience User checkbox is selected, clear it

10. Scroll down to the **Password Policies** section at the bottom of the page
11. Set **User password expire in** to **Never expires** **NOTE:** Failure to this may lead to production outages.
12. Select **Save**

13. In the **Quick Find** field, type **connect**, then select **Manage Connected Apps** from the results

14. Select the app you have created earlier, **Amazon Connect Integration**
15. In the profiles section, select **Manage Profiles**
16. Select the new **API_Only** profile that you just created
17. Select **Save** at the bottom of the page
18. In the **Quick Find** field, type **users** then select **Users** from the results
19. Select New User
20. Set the required fields as:

- a. Last Name: apiuser
- b. Alias: apiuser
- c. Email: provide a valid email address
- d. Username: apiuser@<yoursalesforcedomain>.com
- e. Nickname: apiuser

21. On the right-hand side, set **User License** to **Salesforce**

22. Set Profile to **API_ONLY**

23. Choose **Save**

24. In **Quick Find**, search for "Permission Sets". Select the **AC_Administrator** permission set.

The screenshot shows the Salesforce Setup interface. The left sidebar has a 'Perm' search bar, 'Users' section, 'Permission Set Groups' (selected), and 'Permission Sets' (selected). Below that is a 'Custom Code' section with 'Custom Permissions'. A note says ' Didn't find what you're looking for? Try using Global Search.' The main content area is titled 'Permission Sets' under 'SETUP'. It says 'On this page you can create, view, and manage permission sets.' and 'In addition, you can use the Salesforce mobile app to assign permission sets to a user. Download Salesforce from the App Store or Google Play: iOS | Android'. There's a toolbar with 'All' (selected), 'Edit', 'Delete', and 'Create New View'. A table lists permission sets with columns: Action, Permission Set Label, Description, and License. The 'AC Administrator' row is highlighted with a red box. The table includes rows for AC Agent, AC CallRecording, and AC Manager.

| Action | Permission Set Label | Description | Licenses |
|--------------------------|----------------------|--|----------|
| <input type="checkbox"/> | AC Administrator | Allows the user to configure Amazon Connect setup and provides ... | |
| <input type="checkbox"/> | AC Agent | | |
| <input type="checkbox"/> | AC CallRecording | | |
| <input type="checkbox"/> | AC Manager | | |

25. Select **Manage Assignments**. Add the apiuser you just created to the permission set.

26. A confirmation email with an **activation link** will be sent to the email address provided. Choose the link to activate your user and set their password

27. Fill out the form to set a password for the API user

28. Select **Change Password**. The API user will log into the Salesforce Classic view

29. Access the API user's personal settings by selecting the username in the top right corner, then choose **My Settings**

30. In the **Quick Find** field, type **security** then select **Reset My Security Token** from the results

31. Select **Reset Security Token**. Your security token will be emailed to you

32. Copy the security token from the email to your notepad

Gather Information from Your Amazon Connect Instance

The last thing to do before you can install the Amazon Connect Salesforce Lambda Package is gather some details about your Amazon Connect instance. These will be used during the package installation.

1. In a new browser tab, login to the [AWS console](#)
2. Navigate to the [Amazon Connect Console](#)
3. Select your Instance Alias
4. On the Overview page for your instance, copy the string following instance/ in the Instance ARN and paste it to your notepad. This is your Instance ID.

Overview

Instance ARN arn:aws:connect:us-east-1:YOUR_ACCOUNT_ID:instance/YOUR-INSTANCE-ID-XXX-XXXXXXX

5. In the left nav, select **Data storage**
6. On the **Data storage** page, copy the S3 bucket names for your Call recordings and Exported Reports. The bucket name is everything preceding the first / in the XX will be stored here sections

Data storage

Saving Amazon Connect data such as call recordings or scheduled reports requires access to an Amazon S3 bucket. Your data storage configurations for Amazon Connect is reflected below.

Call recordings

| | | |
|------------------------------------|--|------|
| Call recording will be stored here | YOUR BUCKET NAME/connect/sfsetestconsolidated/CallRecordings | Edit |
| Encrypted using this key | aws/connect | |

Chat transcripts

| | | |
|--------------------------------------|---|------|
| Chat transcripts will be stored here | YOUR BUCKET NAME/connect/sfsetestconsolidated/ChatTranscripts | Edit |
| Encrypted using this key | aws/connect | |

Live media streaming

| | | |
|----------------------|-------------|------|
| Live media streaming | Not enabled | Edit |
|----------------------|-------------|------|

Exported reports

| | | |
|--------------------------------------|---|------|
| Exported reports will be stored here | YOUR BUCKET NAME/connect/sfsetestconsolidated/Reports | Edit |
| Encrypted using this key | aws/connect | |

7. In the left nav, select **Data streaming**

8. Note the name of the Kinesis stream configured in the Contact Trace Records section, then select **Create a new Kinesis Stream**. This will take you to the list of Kinesis streams configured in this region.

9. Select the **Kinesis stream name** that matches what was configured in the previous step

10. On the stream detail page, copy the entire value for Stream ARN

Stream ARN `arn:aws:kinesis:us-east-1:YOUR_ACCOUNT_NUMBER:stream/YOUR_STREAM_NAME`

Status ACTIVE

Store Salesforce Credentials in AWS Secrets Manager

To ensure that your Salesforce credentials are secure, the Lambdas require that the credentials are stored in AWS Secrets Manager. AWS Secrets Manager is a highly secure service that helps you store and retrieve secrets.

1. In a new browser tab, login to the AWS console

2. Make sure you are in the same region as your Amazon Connect instance. You can set the region by expanding the region selector in the upper right and choosing the region

3. Navigate to the [Secrets Manager console](#)

4. Select **Secrets**

5. Select **Store a new secret**

6. Select **Other types of secrets**

7. Make sure **Secret key/value** is selected

8. Enter key value pairs that match the following:

- a. **Key:** Password, **Value:** the password for the API user that you configured in the previous section
- b. **Key:** ConsumerKey, **Value:** the Consumer Key for the Connected App you created in the previous section
- c. **Key:** ConsumerSecret, **Value:** the Consumer Secret for the Connected App you created in the previous section
- d. **Key:** AccessToken, **Value:** this is the access token for the API user that you configured in the previous section

9. For the encryption key, click **Add new key**

10. Select **Create Key**

11. Make sure key type is set to **symmetric**

12. Give your key an **alias**, like *SalesforceCredentialsSecretsManagerKey*

13. Click Next
14. Select administrators you want to have access permission to change the key policy. Make sure you are being as restrictive as possible
15. Click Next
16. Select the users and roles you want to have access to the Salesforce credentials in Secrets Manager. Make sure you are being as restrictive as possible
17. Click Next
18. Click Finish
19. Click on the managed key that you just created (which is *SalesforceCredentialsSecretsManagerKey* in this case).
20. Note down the ARN. This is *SalesforceCredentialsKMSKeyARN* that will be used later when installing the Amazon Connect Salesforce Lambda package.
21. Navigate back to the Secrets Manager setup tab
22. Select the key you just created

Specify the key/value pairs to be stored in this secret [Info](#)

30. You should now have all of the information you need to install the package

Install the Amazon Connect Salesforce Lambda package

1. In a new browser tab, login to the [AWS console](#)
2. Make sure you are in the same region as your Amazon Connect instance
3. Once you have selected the region, navigate to the [Amazon Connect Console](#)
4. Verify that the Amazon Connect instance that you wish to configure is listed
5. Once you have verified your Amazon Connect instance, Open the [Serverless Application Repository Console](#)
6. In the left navigation, select **Available Applications**

The screenshot shows the 'Serverless Application Repository' interface. At the top, there is a header with the repository name and a close button (X). Below the header, there are two tabs: 'Available applications' (which is highlighted with a red box) and 'Published applications'. The main area displays a list of available applications.

7. In the search area, make sure that **Public applications** is selected, check the box for **Show apps that create custom IAM roles or resource policies**, and enter **Salesforce** in the search field, this will automatically filter the available packages

Public applications (4)

Private applications

Salesforce X

Show apps that create custom IAM roles or resource policies

8. Select AmazonConnectSalesForceLambda

Available applications

The screenshot shows the AWS Lambda console interface. At the top, there are tabs for 'Public applications (4)' and 'Private applications'. Below that is a search bar with 'Salesforce' typed in. A checkbox for 'Show apps that create custom IAM roles or resource policies' is checked. The main area displays three application cards:

- Salesforce-API-Access-Manager-Monitor-Logger**: A simple API access manager built on AWS lambda to provide multi tiered access to salesforce services with a single API user. It has 26 deployments.
- AmazonConnectSalesForceLambda**: An AWS Serverless application package containing common Lambda functions for interacting with Salesforce. It allows lookup, create, and update operations for various Salesforce objects like Contacts and Cases. This card is highlighted with a red box. It has 685 deployments.
- alexa-salesforce-notes-sample**: A skill demonstrating how to build a private Alexa skill to access Salesforce data. It identifies opportunities, tracks statements, and posts them as Chatter posts. It has 46 deployments and is an AWS verified author.

9. When the Application loads, scroll down to the **Application settings** section

10. Fill in the parameters using the data you gathered in your notepad in the previous section using the following notes:

- Application name:** You can accept the default here or change it as desired
- CTRKinesisARN:** This is the ARN for the Kinesis stream that was configured for Contact Trace Record streaming in Amazon Connect. This is the complete ARN. Amazon Kinesis Firehose is not supported.
- ConnectRecordingS3BucketName:** This is the name of the S3 bucket used to store recordings for your Amazon Connect instance. This is ONLY the bucket name, no sub-folders or suffixes
- ConnectReportingS3BucketName:** This is the name of the S3 bucket used to store exported reports for your Amazon Connect instance. This is ONLY the bucket name, no sub-folders or suffixes

- e. **HistoricalReportingImportEnabled:** true | false - if set to true, the package will include a feature to import Amazon Connect Queue and Agent Historical Metrics into your Salesforce Org. This feature requires you to provide **ConnectReportingS3BucketName**
- f. **LambdaLoggingLevel:** DEBUG | INFO | WARNING | ERROR | CRITICAL - Logging level for Lambda functions
- g. **PrivateVpcEnabled:** Set to true if functions should be deployed to a private VPC. Set VpcSecurityGroupList and VpcSubnetList if this is set to true.
- h. **RealtimeReportingImportEnabled:** true | false - if set to true, the package will include a feature to publish Amazon Connect Queue Metrics into your Salesforce Org. This feature requires you to provide **AmazonConnectInstanceId**
- i. **SalesforceAdapterNamespace:** This is the namespace for CTI Adapter managed package. The default value is **amazonconnect**. If a non-managed package is used, leave this field blank.
- j. **SalesforceCredentialsKMSKeyARN:** This is the ARN for KMS customer managed key that you created in the previous section.
- k. **SalesforceCredentialsSecretsManagerARN:** This is the ARN for the Secrets Manager Secret that you created in the previous section.
- l. **SalesforceHost:** The full domain for your salesforce org. For example `https://mydevorg-dev-ed.my.salesforce.com`. Please make sure that the host starts with `https`, and that the url ends with `.my.salesforce.com`. This url can be found in `Setup -> My Domain`.
- m. **SalesforceProduction:** true | false - True for Production Environment, False for Sandbox
- n. **SalesforceUsername:** The username for the API user that you configured in the previous section
- o. **SalesforceVersion:** This is the Salesforce.com API version that you noted in the previous section
- p. **VpcSecurityGroupList:** The list of SecurityGroupIds for Virtual Private Cloud (VPC). Not required if PrivateVpcEnabled is set to false.
- q. **VpcSubnetList:** The list of Subnets for the Virtual Private Cloud (VPC). Not required if PrivateVpcEnabled is set to false.
- r. **AmazonConnectInstanceId:** Your Amazon Connect Instance Id. Only required if you enable real time reporting
- s. **AmazonConnectQueueMaxRecords:** Enter record set size for list queue query. Max is 100.

- t. **ContactLensImportEnabled:** true | false - Set to false if importing Contact Lens into Salesforce should not be enabled.
- u. **CTREventSourceMappingMaximumRetryAttempts:** Maximum retry attempts on failure for lambdas triggered by Kinesis Events.
- v. **AmazonConnectQueueMetricsMaxRecords:** Enter record set size for queue metrics query. Max is 100.
- w. **PostcallCTRImportEnabled:** true | false - Set to false if importing CTRs into Salesforce should not be enabled on the package level. This setting can be disabled on a call-by-call basis.
- x. **PostcallRecordingImportEnabled:** true | false - Set to false if importing call recordings into Salesforce should not be enabled on the package level. This setting can be disabled on a call-by-call basis.
- y. **PostcallTranscribeEnabled:** true | false - Set to false if post-call transcription should not be enabled on the package level. This setting can be disabled on a call-by-call basis.
- z. **TranscribeOutputS3BucketName:** This is the S3 bucket where Amazon Transcribe stores the output. Typically, this is the same bucket that call recordings are stored in, so you can use the same value as found in **ConnectRecordingS3BucketName**. Not required if PostcallRecordingImportEnabled, PostcallTranscribeEnabled, ContactLensImportEnabled set to false.
- z. **TranscriptionJobCheckWaitTime:** Time between transcription job checks

11. Once you have completed the form, select **Deploy**

12. Deployment will take some time, with status updates being provided by the UI. Once it has completely deployed, you will receive a notification on the screen

[View CloudFormation Stack](#)

Test the Core Functionality

The package provides a core Lambda function (`sflInvokeAPI`) that supports multiple operations, like lookup, create and update. For the initial validation, sample events are provided within the function.

Validating this function provides a good check that the installation and configuration is correct.

Validating the lambda functions requires the use of test events to simulate data coming into the function as it would in a typical deployment. Each function has a set of test event samples included to make validation easier.

Validate the core functionality

1. In a new browser tab, login to the [AWS console](#)
2. Open the [AWS Lambda Console](#)
3. In the Filter field, enter sfInvokeAPI and press enter, this will filter your list out to the core function that we just installed

The screenshot shows the AWS Lambda Functions list. At the top, there is a search bar with 'Add filter' and a keyword input field containing 'Keyword : sfInvokeAPI'. Below the search bar, there is a table header with columns: Function name, Description, Runtime, and Code size. A single function is listed in the table:

| Function name | Description | Runtime | Code size |
|---|-------------|------------|-----------|
| serverlessrepo-SFConsolidatedLambdaPac-sfInvokeAPI-5504EV6KL9E8 | | Python 3.7 | 32.1 kB |

4. Select the **function name**. First, we will validate a phone number lookup.
5. In the Environment pane, double-click the event-phoneLookup.json file

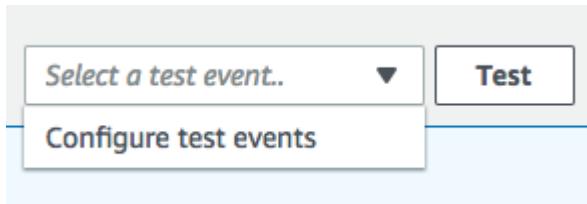

The screenshot shows the AWS Lambda Environment pane. On the left, there is a sidebar with 'Environment' and a file tree. The file tree shows a folder named 'serverlessrepo-SFC' with several files: event-create.json, event-lookup.json, event-phoneLookup.json, event-update.json, salesforce.py, and sf_util.py. The 'event-phoneLookup.json' file is highlighted with a red box.

6. The test even JSON will open in the Lambda editor
7. Modify the value for sf_phone to match the phone number of the test contact you created when you setup the CTI adapter or for any valid contact in your Salesforce org| NOTE: The phone number must be in [E.164 format](#)

```
1 {  
2     "Details": {  
3         "Parameters": {  
4             "sf_operation": "phoneLookup",  
5             "sf_phone": "+14155551212",  
6             "sf_fields": "Id, Name, Email"  
7         }  
8     }  
9 }
```

8. Select the entire JSON event and copy it, then close the **event-phoneLookup.json** tab.

9. In the top-right corner, select drop-down arrow next to **Test** and choose **Configure test events**

10. Select the radio button for **Create new test event** and provide an event name, for example: **phoneLookup**

11. Select the existing event JSON and **delete** it. Paste the modified JSON payload you copied from the **event-phoneLookup.json** file

Configure test event X

A function can have up to 10 test events. The events are persisted so you can switch to another computer or web browser and test your function with the same events.

Create new test event
 Edit saved test events

Event template

Hello World

Event name

phoneLookup

```
1 {  
2     "Details": {  
3         "Parameters": {  
4             "sf_operation": "phoneLookup",  
5             "sf_phone": "+14155551212",  
6             "sf_fields": "Id, Name, Email"  
7         }  
8     }  
9 }
```

12. Select **Create** to save your test event

13. By default, your new test event should be selected in the drop-down list to the left of the **Test** button.

14. Select **Test**

15. If successful, the result will contain fields defined in "sf_fields" parameter in the invocation event

 Execution result: succeeded ([logs](#))

[▼ Details](#)

The area below shows the result returned by your function execution. [Learn more](#)

```
{  
  "Id": "0036g000007mkZ2AAI",  
  "Name": "John Smith",  
  "Email": null,  
  "sf_count": 1  
}
```

16. Copy the value for the **Id** key in the response. Next, we are going to use that Id to create a Case in Salesforce.

17. In the Environment pane, double-click the **event-create.json** file. Replace the existing ContactId value with the ID value you copied previously.

```
1 {  
2   "Details": {  
3     "Parameters": {  
4       "sf_operation" : "create",  
5       "sf_object": "Case",  
6       "Origin": "Phone",  
7       "Status": "New",  
8       "ContactId": "0036g000007mkZ2AAI",  
9       "Subject": "Amazon Connect Case",  
10      "Priority": "Low"  
11    }  
12  }  
13 }
```

18. Select the entire JSON event and copy it, then close the **event-create.json** tab.

19. In the top-right corner, select drop-down arrow next to **Test** and choose **Configure test events**

The screenshot shows the AWS Lambda function configuration interface. At the top, there's a header with the function name 'phoneLookup' and buttons for 'Test' and 'Save'. Below the header, under the heading 'Saved Test Events', there is a list. The first item, 'phoneLookup', has a blue background. The second item, 'Configure test events', is highlighted with a red border. To the right of the list is a small preview area.

20. Select the radio button for **Create new test event** and provide an event name, for example: **createCase**

21. Select the existing event JSON and **delete** it. Paste the modified JSON payload you copied from the **event-create.json** file

The screenshot shows the 'Configure test event' dialog box. At the top, it says 'Configure test event' and has a close button. Below that, a note states: 'A function can have up to 10 test events. The events are persisted so you can switch to another computer or web browser and test your function with the same events.' There are two radio buttons: 'Create new test event' (selected) and 'Edit saved test events'. Under 'Event template', a dropdown menu shows 'phoneLookup'. In the 'Event name' field, 'createCase' is entered. Below that, the 'Event details' field contains the following JSON payload:

```
1 - {  
2 -   "Details": {  
3 -     "Parameters": {  
4 -       "sf_operation": "create",  
5 -       "sf_object": "Case",  
6 -       "Origin": "Phone",  
7 -       "Status": "New",  
8 -       "ContactId": "0036g000007mkZ2AAI",  
9 -       "Subject": "Amazon Connect Case",  
10 -      "Priority": "Low"  
11 -    }  
12 -  }  
13 }
```

22. Select **Create** to save your test event

23. By default, your new test event should be selected in the drop-down list to the left of the Test button.

The screenshot shows the AWS Lambda function configuration interface again. At the top, there's a header with the function name 'createCase' and buttons for 'Test' and 'Save'. Below the header, under the heading 'Saved Test Events', there is a list. The first item, 'createCase', has a blue background, indicating it is selected. To the right of the list is a small preview area.

24. Select **Test**

25. If successful, the result will contain the Case Id

Execution result: succeeded ([logs](#))

▼ Details

The area below shows the result returned by your function execution. [Learn](#)

```
{  
  "Id": "5006g000008AfEBAA0"  
}
```

26. Copy the value for the **Id** key in the response.

27. When we created the case, the **Status was set to New** and the **Priority to Low**. We are going to use the update operation to close the case.

28. In the Environment pane, double-click the **event-update.json** file and replace the existing Case Id in "sf_id" parameter with the new one you copied from the last test result

29. Select the **entire JSON event** and copy it, then close the **event-update.json** tab.

30. In the top-right corner, select drop-down arrow next to **Test** and choose **Configure test events**

31. Select the radio button for **Create new test event** and provide an event name, for example: **updateCase**

32. Select the existing event JSON and **delete** it. Paste the modified JSON payload you copied from the **event-update.json** file

Configure test event X

A function can have up to 10 test events. The events are persisted so you can switch to another computer or web browser and test your function with the same events.

Create new test event

```

33. Select **Create** to save your test event

34. By default, your new test event should be selected in the drop-down list to the left of the Test button.

closeCase ▼ Test Save

35. Select **Test**

36. If successful, the result will be the **HTTP 204 No Content** success status response code

✓ Execution result: succeeded ([logs](#))

▼ Details

The area below shows the result returned by your function

```
{  
  "Status": 204  
}
```

37. Log in into your Salesforce org and go to the **Service Console**

38. In the search box, change the object type to Cases and type Amazon Connect Case, then press enter

39. You should find 1 case opened by the API user, and the status should be closed

| Cases | | | | | |
|-------------|---------------------|--------|---------------------|------------------|-------------------------------------|
| 1 Result | | | | | |
| Case Number | Subject | Status | Date/Time Opened | Case Owner Alias | |
| 00001026 | Amazon Connect Case | Closed | 1/23/2020, 10:13 PM | apiuser | <input type="button" value="View"/> |

40. You have completed core function validation

Allow Amazon Connect to Access the `sflnvokeAPI` Lambda Function

Once you have validated function, you can use the Amazon Connect console to add the `sflnvokeAPI` Lambda function to your Amazon Connect instance. This automatically adds resource permissions that allow Amazon Connect to invoke the function.

Add the Lambda function to your Amazon Connect instance

1. In a new browser tab, login to the [AWS console](#)

2. Navigate to the [Amazon Connect Console](#)

3. Select your **Instance Alias**

4. In the navigation pane, choose **Contact flows**.

[Amazon Connect](#) > sfctifinal022020

5. For **AWS Lambda**, select the function that includes `sflnvokeAPI` in the name

AWS Lambda

Amazon Connect can interact with your own systems and take different paths in IVR dynamically. To achieve this, invoke AWS Lambda functions in contact flows to interact with your own systems or other services, then build personalized and dynamic experiences based on data returned.

Note: By adding Lambda functions, you are granting Amazon Connect permission to invoke them [Create a new Lambda function](#)

Function serverlessrepo-AmazonConnectSalesforce-sfInvokeAPI-[REDACTED] [+ Add Lambda Function](#)

6. Choose **Add Lambda Function**. Confirm that the ARN of the function is added under **Lambda Functions**.

Lambda Functions

| | | |
|---|---|------------------------|
| serverlessrepo-AmazonConnectSalesforce-sfInvokeAPI-[REDACTED] | arn:aws:lambda:us-west-2:[REDACTED]function:serverlessrepo-AmazonConnectSalesforce-sfInvokeAPI-[REDACTED] | Remove |
|---|---|------------------------|

7. The AWS Lambda function has been added to your Amazon Connect instance.

Upgrading from an Earlier Version

If you are upgrading from an earlier version of CTI Adapter, there are a few additional things you need to do.

1. Go to the **Setup** section and search for **Object Manager**.

2. In Object Manager section, search for "AC CTI"

The screenshot shows the AWS Lambda Functions page. At the top, there is a dropdown menu set to "serverlessrepo-AmazonConnectSalesforce-sfInvokeAPI-[REDACTED]" and a button "+ Add Lambda Function". Below this, a table lists one Lambda function:

| Function | ARN | Action |
|---|---|------------------------|
| serverlessrepo-AmazonConnectSalesforce-sfInvokeAPI-[REDACTED] | arn:aws:lambda:us-west-2:[REDACTED]function:serverlessrepo-AmazonConnectSalesforce-sfInvokeAPI-[REDACTED] | Remove |

3. Open up **AC CTI Adapter**

4. On the left sidebar, click on **Page Layouts**

5. Click on **Page Layout Assignment**

6. On the next page, click on **Edit Assignments**

7. Click on the grey bar at the top of the table to select all rows.

12. Go to your **CTI Adapter**.

13. Click on any of the CTI Flows and scroll down to the section labeled **CTI Flow**. You should see something like this:

Invalid Script

Please note that starting from version 4.6, your scripts will need to be migrated to our new CTI Flows.

You can download your current script below

When you are ready to try out the CTI Flow editor, click Continue.

14. Click **Download** and save your script before clicking **Continue**.

15. Use the CTI Block primitives in the editor to re-create your script as a CTI Flow.

16. Refer to the Sample Flows in the Appendix of this manual.

CTI Adapter Installation Troubleshooting and Common Issues

I upgraded my adapter to v5.10, but I cannot see the CCP Config changes

There is a bug with Salesforce that doesn't update a page layout when you upgrade a package. To fix this, go to Setup and search for **Object Manager**. Once you're on the Object Manager page, search for the **AC CTI Adapter** object and click on it. Then go into **Page Layouts** and click on the layout you are using (Typically **AC CTI Adapter Layout – August 2020**). Then, drag and drop the **Audio Device Settings** and **Page Layout Settings** into the desired spot on the page. Finally, hit save.

The screenshot shows the Salesforce Setup > Object Manager interface. The top navigation bar has 'SETUP > OBJECT MANAGER' and the specific object name 'AC CTI Adapter' highlighted with a red box. The left sidebar menu is visible with various options like Details, Fields & Relationships, Page Layouts (which is selected and highlighted with a blue box), Lightning Record Pages, Buttons, Links, and Actions, Compact Layouts, Field Sets, Object Limits, Record Types, Related Lookup Filters, Search Layouts, Search Layouts for Salesforce Classic, and Triggers. The main content area shows the 'AC CTI Adapter Detail' page. At the top, there are 'Save', 'Quick Save', 'Preview As...', 'Cancel', 'Undo', 'Redo', and 'Layout Properties' buttons. Below these are tabs for 'Fields' and 'Salesforce Mobile and Lightning Experience Actions'. The 'Fields' tab displays a grid of fields: Buttons, Quick Actions, Mobile & Lightning Actions, Expanded Lookups, Related Lists, Report Charts, Section, Blank Space, Audio Device Set..., Connect Instance..., Custom Ringtone, Medialess, Softphone Popout..., SSO Relay State, CTI Adapter Name, Enable Softphone..., Phone Type Settings, Call Center Defin..., SSO Url, Amazon Connect In..., CCP Version, Custom Chat Ringtone, Last Modified By, Presence Sync Ena..., and User Defined. The 'Phone Type Settings' field is also highlighted with a red box. The 'Salesforce Mobile and Lightning Experience Actions' section contains a note about overriding predefined actions. The 'AC CTI Adapter Detail' section shows information like CTI Adapter Name (Sample Text), Amazon Connect Instance Region (Sample Text), Call Center Definition Name (Sample Text), Debug Level (Sample Text), Presence Sync Enabled (checked), and Phone Type Settings (checked). The 'Standard Buttons' toolbar at the bottom includes Edit, Delete, Clone, Change Owner, Change Record Type, Printable View, Sharing, and Get Alerts.

Error “refused to run the JavaScript URL because it violates the following Content Security Policy directive...”

This is an allowlisting issue, please review the installation and ensure that both URLs are properly allowlisted.

BeaconLibrary.js:38

⚠ DevTools failed to load SourceMap: Could not load content for https://c.la1-c1.cs-ord.salesforceliveagent.com/content/dev/resources/js/scrt.min.js.map: HTTP

This can happen if the customer has checked "Enable clickjack protection" on Salesforce session settings. The solution is to uncheck that.

The screenshot shows the Salesforce Setup interface with the 'Session Settings' tab selected. In the 'Clickjack Protection' section, there are two checkboxes under 'Setup pages': 'Enable clickjack protection for Setup pages' (unchecked) and 'Enable clickjack protection for non-Setup Salesforce pages' (checked). A red arrow points to the checked checkbox. A tooltip for the checked checkbox states: 'Protect against clickjack attacks and allow framing on whitelisted external domains'.

What are the Disable X Trigger options in the Custom Settings?

The screenshot shows the 'Edit Toolkit for Amazon Connect' page. Under the 'Toolkit for Amazon Connect Information' section, there are four 'Disable the CCA Case Trigger' checkboxes, all of which are checked (indicated by a blue checkmark). The checkboxes are labeled: 'Disable the CCA Case Trigger', 'Disable the CCA Contact Trigger', 'Disable the Case Contact CCA Trigger', and 'Disable the Task Trigger'. Below these checkboxes is a 'Url' input field with a placeholder 'Url' and a small info icon.

These are options we provide that allow you to toggle certain functionality in the adapter.

- CCA Case Trigger - This trigger looks for any ContactChannelAnalytics records that could be related to a updated/inserted Case, and creates a relationsihp between the two records.
- CCA Contact Trigger - This trigger looks for any ContactChannelAnalytics records that could be related to a updated/inserted Contact, and creates a relationsihp between the two records.
- Case Contact CCA Trigger - This trigger looks for any Case/Contact records that could be related to an updated/inserted ContactChannelAnalytics record, and creates a relationsihp between the records.
- Task Trigger - This trigger creates a ContactChannel record for any inserted/updated task that with a `CallObject` field that does not currently have a ContactChannel record created before.

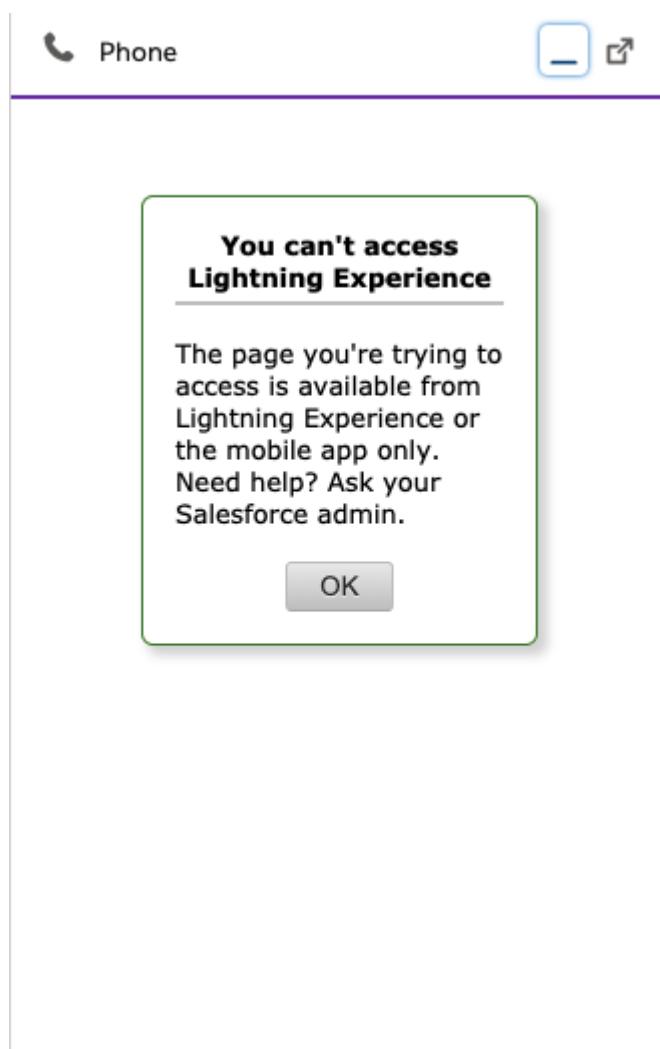

I upgraded my adapter to v5, but I don't see the CTI Flows feature.

See the [Upgrading from an Earlier Version](#) section of the installation guide.

I upgraded my adapter from v3 to v5 and we lost some screenpop functionality.

All screenpop functionality native to v3 now needs to be recreated using CTI Flows. Please review the [CTI Flow Examples](#) for more details, all screenpop functionality from v3 has been recreated.

The CCP doesn't show up in service console and I instead see the following image:

Copy the full url of the lightning adapter visualforce page into the call center.

Certain picklists are missing picklist items.

When upgrading from a version of the package to a higher version of the package in which new picklist items were added to a picklist, those new picklist items won't be installed. This is a [known Salesforce issue](#).

I upgraded my adapter to v5.10, but I cannot see the CCP Config changes

There is a bug with Salesforce that doesn't update a page layout when you upgrade a package. To fix this, go to Setup and search for **Object Manager**. Once you're on the Object Manager page, search for the **AC CTI Adapter** object and click on it. Then go into **Page Layouts** and click on the layout you are using (Typically **AC CTI Adapter Layout – August 2020**). Then, drag and drop the **Audio Device Settings** and **Page Layout Settings** into the desired spot on the page. Finally, hit save.

The screenshot shows the Salesforce Object Manager interface for the 'AC CTI Adapter' object. The left sidebar has a 'Page Layouts' section selected. The main area shows the 'Fields' section of the page layout configuration. Several fields are highlighted with red boxes: 'Audio Device Set...' (under Fields), 'Phone Type Settings' (under Fields), and 'Phone Type Settings' (under 'AC CTI Adapter Detail' section). The 'AC CTI Adapter Detail' section also has its 'Audio Device Settings' field highlighted with a red box.

CTI Adapter Details

The CTI Adapter configuration begins with the adapter details. These fields provide the basic information needed to relate the Adapter to the call center configuration in Salesforce and, ultimately, to the agents and supervisors that will be using the platform.

The screenshot shows the 'Details' tab of the CTI Adapter configuration screen. It lists various adapter settings:

| Setting | Value |
|--------------------------------|---|
| CTI Adapter Name | ACLightningAdapter |
| Amazon Connect Instance | https://sfadAPTERtest.awsapps.com/ |
| Custom Ringtone | |
| Softphone Popout Enabled | <input checked="" type="checkbox"/> |
| Medialess | <input type="checkbox"/> |
| Audio Device Settings | <input type="checkbox"/> |
| Owner | [Redacted] |
| Amazon Connect Instance Region | us-east-1 |
| Call Center Definition Name | ACLightningAdapter |
| Debug Level | Off |
| Presence Sync Enabled | <input checked="" type="checkbox"/> |
| Phone Type Settings | <input checked="" type="checkbox"/> |

At the bottom, there is a 'Single SignOn (SSO)' section with a checkbox.

Update the CTI Adapter Details

- 1. CTI Adapter Name:** provide a unique name for this CTI adapter definition
- 2. Amazon Connect Instance:** This was configured in a previous section. This is the instance url for your Amazon Connect instance.
- 3. Amazon Connect Instance Region:** This is the code for the region that you have deployed your Amazon Connect instance to. This is required for the Amazon Connect chat APIs to work correctly. If you do not use the chat feature of Amazon Connect, this field is not necessary
- 4. Custom Ringtone:** This allows for overriding the built-in ringtone with any browser-supported audio file accessible by the user.
- 5. Call Center Definition Name:** This was configured in a previous section. This is the internal name of the Call Center configured in Salesforce setup. This value links the CTI Adapter to the Call Center, and ultimately to the agents.
- 6. Softphone Popout Enabled:** Salesforce supports softphone pop out in Console and Lightning Experience modes. When the softphone is popped out, it opens in a new browser window external to the Salesforce UI. This is helpful in use cases where the call controls are regularly needed but the agent also needs full access to the entire console.
- 7. Debug Level:** For future use
- 8. Medialess:** Amazon Connect supports running in VDI environments, however best practice is to send the actual audio stream via a separate CCP. Selecting the medialess option will configure the Salesforce CCP to run in medialess mode, which provides the data that Salesforce needs for screenpop while the audio is streamed to a local CCP.
- 9. Presence Sync Enabled:** This setting allows the adapter to use the presence rules to sync state from Amazon Connect to Salesforce Omni-Channel.
- 10. Audio Device Settings** Turning this setting on allows the Agent to setup a custom audio device for their speaker, microphone and ringer in the adapter (Speaker and Ringer settings not available on Firefox). You may have to add this field to the layout manually. [See troubleshooting](#).
- 11. Phone Type Settings** Turning this setting on allows the Agent to change their Phone Type in the CCP. You may have to add this field to the layout manually. [See troubleshooting](#).

Single Sign On Settings

The Amazon Connect CTI Adapter supports single sign on(SSO) via SAML integration. This allows customers that use a SAML provider for authentication into Amazon Connect. You will need the SSO URL for your provider and the Relay State settings for your Amazon Connect instance.

For general information on configuring SAML for Amazon Connect, please refer to: [Amazon Connect Administrator Guide: Configure SAML for Identity Management in Amazon Connect](#).

If you wish to use **Salesforce** as your identity provider for Single Sign On, please follow the setup instructions in [Appendix B - Configuring Salesforce as Your Identity Provider](#).

For information about configuring specific SAML providers to work with Amazon Connect:

- [AWS Single Sign-On](#)
- [Okta](#)

Once you have your SAML integration working with Amazon Connect, you will need to create the Amazon Connect Single Sign On URL and validate that it works correctly, then configure the Lightning CTI adapter and login the agent.

Identify the SSO URL components

In order to authenticate with Amazon Connect, you need your IdP login URL from your SAML provider and a relay state URL that will redirect the authenticated user to your Amazon Connect instance.

Your IdP Login URL will resemble the following (Salesforce is shown):

`https://m*****run-dev-ed.my.salesforce.com/idp/login?app=0sp0N000000Caid`

The 'RelayState' will be in the following format:

`https://console.aws.amazon.com/connect/federate/InstanceId?destination=%2Fconnect%2Fccp`

Please note that "console.aws.amazon.com" refers to US-East-1 region (N. Virginia). If your Amazon Connect instance is in a different region, please use the region Console URL. For example:

`https://us-west-2.console.aws.amazon.com/connect/federate/InstanceId?destination=%2Fconnect%2Fccp`

Configure the CTI Lightning Adapter in Salesforce

Now we are ready to complete the last step in the configuration process: Adding the SSO settings to the Lightning Adapter. This will configure the adapter to authenticate via SSO and redirect to the Amazon Connect Contact Control Panel once authentication completes.

1. Log in into your Salesforce org and go to the **Service Console**
2. Expand the **navigation menu** by selecting the down arrow and choose **AC CTI Adapters**.

The screenshot shows the Salesforce Service Console Home page. At the top, there's a navigation bar with 'All' and a search bar. Below it, the main area has a 'Quarterly Performance' summary with metrics like 'CLOSED \$1,820,000' and 'OPEN (>70)'. On the right, there are three buttons: 'AC CTI Adapters' (highlighted with a red box), 'Cases', and 'Contacts'.

3. Select ACLightningAdapter

4. Scroll down to the Single SignOn (SSO) section and choose the pencil icon of either field to edit

▼ Single SignOn (SSO)

SSO Url

SSO Relay State

5. For the SSO Url, paste your IdP login URL up to the first question mark (if one exists). A couple of examples are provided: Salesforce:

https://m*****run-dev-ed.my.salesforce.com/idp/login?app=0sp0N000000Caid

Microsoft ADFS:

<https://sts.yourcorp.com/adfs/ls/idpinitiatedsignon.aspx>

6. Paste this portion of the URL into the **SSO Url** field

▼ Single SignOn (SSO)

SSO Url

`https://sample-dev-ed.my.salesforce.com/idp/login`

7. For the SSO Relay State: IF you had a question mark in your login URL, paste everything AFTER the question mark into the SSO Relay state field, then add &RelayState= to the end, and append your relay state URL. For example:

`app=0sp0N000000Caid&RelayState=https://console.aws.amazon.com/connect/federate/InstanceId?destination=%2Fconnect%2Fccp`

IF you did not have a Question Mark, then enter &RelayState= into the SSO Relay State field and append your relay statue URL to it. For example:

&RelayState=https://console.aws.amazon.com/connect/federate/**instanceId**?destination=%2Fconnect%2Fccp

8. Example of a completed SSO section (Salesforce is shown)

▼ Single SignOn (SSO)

| | |
|-----------------|---|
| SSO Url | <input type="text" value="https://sample-dev-ed.my.salesforce.com/idp/login"/> |
| SSO Relay State | <input type="text" value="app=0sp6g000000XZyd&RelayState=https://us-west-2.console.aws.amazon.com/connect/federate/YOUR-INSTANCE-ID?destination=%2Fconnect%2Fccp"/> |

9. Choose **Save**

10. **Refresh** your browser to make the changes take effect

- a. **NOTE:** If you receive a blocked popup warning, select the warning and change the setting to always allow popups from your Salesforce org, then refresh the browser again

11. After a few seconds, a new window should pop up for a moment. This window is performing the authentication and setting your session cookie. Once it does this, it will close automatically.

Change status ▾

Initializing...

12. Once the authentication window closes, select the **phone icon** in the console toolbar to open the CCP Note: You may also receive popups to allow notifications and microphone access. Please accept both.
13. You should now see the authenticated and logged in CCP

CTI Attributes

CTI Attributes provide the ability to reference and display contact attribute data within the Amazon Connect Contact Control Panel (CCP). This allows for easy access to data or URLs that may be necessary for agents to perform tasks external to Salesforce. Adding attributes does not import data directly into Salesforce. Instead, it is simply available in the CCP for the life of the contact.

Attribute Properties

When configuring CTI attributes, you will need to complete the configuration with the following information:

- **CTI Attribute Name:** the user-friendly name that will identify this attribute configuration. This is not the name or key of the attribute itself.
- **Label:** will be displayed in the CCP as the label for the attribute value.
- **Display:** indicates how this attribute should be displayed. Options are:
 - --None--: this attribute will not be displayed, however it will be available for use. Typically, this is used to define attributes that will be used in URLs.
 - Key-Value: the attribute label and value will both be displayed as a key-value pair
 - Key: only the label is displayed. This can be used to create sections in the attribute list. For example, you could have an "Address" label followed by individual attributes for street, city, state, country, postal code, etc
 - Value: only the value is displayed. This can be used when displaying several values under one section or when displaying a URL that needs no label.
- **Type:** indicates if this is a text or URL attribute
- **Style:** allows you to specify a CSS style rule for the display of this attribute. The style will apply to both the label and the value.
- **Format:** the format allows you to define which contact attributes will be used in the value of this CTI attribute. Contact attributes are referenced by their key name enclosed in double curly braces. For example, an Amazon Connect contact attribute of accountId would be referenced as `accountId`.
- **Active (checkbox):** indicates if this CTI attribute is active
- **Default Value:** value to be displayed if the contact attribute referenced is not found

Once you set the CTI attributes, you access them by choosing the appropriate icon during a connected contact

CTI Attributes Example Walkthrough

Since there are endless use cases for CTI attributes, this guide will walk through a couple examples that show you how both text and hyperlink based attributes are configured, presented, and used. These examples are not intended to remain in your configuration and are instead designed to provide you with the experience of configuring a functional attribute.

Adding a Text-based CTI Attribute

In this example, we will walk through creating a new CTI Attribute based on a contact attribute named "phone_number" and add it to the CCP. In our scenario, the contact flow has set this attribute using input from the customer to indicate their phone number of record. In order for this example to work, your contact flow must also set a contact attribute named "phone_number"

1. Log in into your Salesforce org and go to the **Service Console**
2. Expand the **navigation menu** by selecting the down arrow and choose **AC CTI Adapters**.

3. Select **ACLightningAdapter**

4. Scroll down to the **Attributes** section and select New

A screenshot of the 'Attributes' list page. The title is 'Attributes (0)'. Below it, a message says '0 items · Sorted by CTI Attribute Name · Updated a few seconds ago'. In the bottom right corner, there is a 'New' button, which is highlighted with a red box.

5. Provide a **CTI Attribute Name** value, for example: customer_phone

6. Provide the **Label** name, for example: Callback Phone

7. Select the **Display** option, in this case: Key-Value

8. Select Text as the **Type**

9. For **Style**, enter the following: color: red

10. In the **Format** field, enter `phone_number` to reference the incoming contact attribute

11. Set **Default Value** to unk

12. Choose Save

13. Refresh your browser

14. Place a new call into your Amazon Connect instance and accept the call as an agent

15. Once the call is connected, select the text attribute icon to expand the CTI Attributes

16. Note the Style formatting. Also note that you can quickly copy the content of the attribute by selecting the clipboard icon.

17. Disconnect the contact.

Adding a Hyperlink-based CTI Attribute

In this example, we will walk through creating a new hyperlink CTI Attribute that incorporates a contact attribute named "postal_code" and add it to the CCP. In our scenario, the contact flow has set this attribute using a data query into Salesforce. In order for this example to work, your contact flow must also set a contact attribute named "postal_code"

Use text

Use attribute

Destination key
postal_code

Type
External

Attribute
postCode

1. Log in into your Salesforce org and go to the **Service Console**
2. Expand the **navigation menu** by selecting the down arrow and choose **AC CTI Adapters**.

3. Select **ACLightningAdapter**
4. Scroll down to the **Attributes** section and select New

This screenshot shows the 'Attributes' section of the AC Lightning Adapter configuration. At the top, there's a header with a small orange icon and the text 'Attributes (0)'. Below it, a message says '0 items · Sorted by CTI Attribute Name · Updated a few seconds ago'. In the bottom right corner of this header area, there is a small rectangular button with the word 'New' in it, which is also highlighted with a red box.

5. Provide a **CTI Attribute Name** value, for example: postal_code
6. Provide the **Label** name, for example: MapIt
7. Select the **Display** option, in this case: Key-Value
8. Select Hyperlink as the **Type**
9. Leave **Style** blank

10. In the **Format** field, enter

`https://www.google.com/maps/search/postal_code`

to append the incoming contact attribute to the URL

11. Set **Default Value** to unk

12. Choose Save

| CTI Adapter | |
|---|--|
| <u>ACLightningAdapter</u> | |
| CTI Attribute Name | <input type="text" value="postal_code"/> |
| Label | <input type="text" value="MapIt"/> |
| Type | <input type="text" value="Hyperlink"/> |
| Format | <input type="text" value="https://www.google.com/maps/search/{{p ostal_code}}"/> |
| Default Value | <input type="text" value="unk"/> |
| Display | <input type="text" value="Key-Value"/> |
| Style | <input type="text"/> |
| Active | <input checked="" type="checkbox"/> |

13. Refresh your browser

14. Place a new call into your Amazon Connect instance and accept the call as an agent

15. Once the call is connected, select the hyperlink attribute icon to expand the CTI Attributes

Phone

16. Select the URL and observe the page load

17. Disconnect the contact.

CTI Attribute Additional Features

Enabling CTI Attribute Additional Features

The additional CTI Attribute features allow you to further customize CTI Attributes.

1. In Service Console, navigate to your CTI Adapter

2. Scroll down to the features section of your AC CTI Adapter and select **new**

3. Set the AC Feature Name to **FEATURE_CTI_ATTRIBUTES**

4. Fill the value text box to contain the following settings:

- a. **ShowAttributesIfEmpty** (Boolean, default true): show attributes text box when contact has no attributes
- b. **ShowAllAttributes** (Boolean, default false): show all attributes, including attributes with no values

* AC Feature Name

FEATURE_CTI_ATTRIBUTES

5. Select **Save**

CTI Flow

The CTI Adapter provides a mechanism to customize the behavior of the adapter based on your business needs without needing to edit the underlying Visualforce pages, which could negatively impact overall adapter function. This is accomplished through CTI Flows.

A CTI Flow consist of "actions" that represent an API call to parts of Salesforce or Amazon Connect API. Like a JavaScript function, each action can take inputs and provide outputs, or returns values, that you can use from other actions.

To create a new CTI Flow, log in into your Salesforce org and go to the **Service Console**. Expand the **navigation menu** by selecting the down arrow and choose **AC CTI Adapters**.

The screenshot shows the top navigation bar of the Salesforce Service Console. On the left is the blue cloud icon. Next to it are the words 'Service Console' and a home icon. To the right is a dropdown menu with 'Home' selected. Below the main bar, there's a secondary navigation bar with a purple header. On the left of this bar is a 'Quarterly Performance' card showing 'CLOSED \$1,820,000' and 'OPEN (>70)' with a value of '2.5M'. To the right of the performance card are three items: 'AC CTI Adapters' (which has a red box around it), 'Cases', and 'Contacts'. Each item has a small icon to its left.

Select **ACLightningAdapter**. Scroll down to the **CTI Flows** section and select New to create a new CTI Script.

This will take you to a form where you can fill in name and adapter of the CTI Flow. There are a couple of fields that you may be unfamiliar with: **Source** and **Event**.

Let's look at **Source** field first.

* Source

Amazon Connect Voice Contact

--None--

Initialization

Amazon Connect Agent

✓ Amazon Connect Voice Contact

Amazon Connect Queue Callback Contact

Amazon Connect Chat Contact

Salesforce Agent

You can think of Source as the "origin" of the CTI Flow. There are currently 7 sources: Initialization, an Agent on Connect, Voice Contact on Connect, Queue Callback Contact on Connect, Chat on Connect, Salesforce Agent or Salesforce UI.

Each source comes with a set of events that you can hook into, i.e. your CTI Flow will be executed when one of these events fire. Typically, you will have only one flow for a combination of a source and an event. (You can find out more about sources and events in [Appendix C - CTI Flow Sources and Events](#).)

For the purposes of this example, we selected **Amazon Connect Voice Contact** source and **onConnecting** event. Now click Save and on the next page scroll down till you find the **CTI Flow** section.

▼ CTI Flow

Main Menu

Save

Let's build a CTI Flow that opens a screenpop in Salesforce when a voice call comes.

You can start using by dragging the item called **CTI Block** from the sidebar in the Main Menu over the stage, which is marked by a grid pattern.

When you drop the block, you will see a modal titled **Explorer**. This modal contains a list of actions you can choose from.

Explorer

| Search | Format Phone Number | Format Phone Number (E164) |
|---|---|--|
| phone | Formats a phone number for a country code. Parameters > What it calls: <code>ac.Utils.Common.formatPhoneNumber(...)</code> Select | Formats a phone number for a country code in E164 format. Parameters > What it calls: <code>ac.Utils.Common.formatPhoneNumberE164(...)</code> Select |
| Categories Filter by category | Showing 13 actions | |
| Tags Filter by tag | | |
| Showing 13 actions | | |
| Save search | | |
| Searches (Clear) phone date | Get Softphone Layout The query to get softphone layout. What it calls: <code>ac.Utils.Salesforce.getSoftphoneLayout()</code> | Show Softphone Panel The command to show softphone panel. What it calls: <code>ac.Utils.Salesforce.showSoftphonePanel()</code> |

In the **Search** field, search for **Phone** and Select the action called **Get Customer Phone Number** from the results on the right.

Change type ▾

Get Customer Phone Number

ID: uid-0

Remove About this action

Return Values

This action has a return value. It returns the following fields. You may use these fields in the input fields of connected actions.

| | |
|---------|------------------------------|
| phone | Phone number of the caller. |
| country | Country of the phone number. |

You should now see a block on the stage for the action you selected, and the sidebar will display some information about this action, including its return value.

(Note: If you'd like to change the label of the action, doubleclick on it. This will open a text editor. Make your changes and when you're finished click outside the node to save your label.)

Some actions can be configured using input fields to provide arguments to function calls, as well. This action does not have any input fields, and returns two values ---- **phone** and **country**.

Now let's drag another CTI Block over the stage and find an action called **Search and Screenpop**.

Change type ▾

Search And Screenpop

ID: uid-9

Remove About this action

Arguments

searchParams ⓘ

Enter a value

queryParams ⓘ

Enter a value

defaultFieldValues ⓘ

Add a field

deferred ⓘ

Connect these blocks by clicking the green socket (green means "done") on **Get Customer Phone**, which will display a blue line that tracks your mouse cursor around the stage.

Now, click on the pink socket, i.e. the **input** socket, which is to the left of the **Search and Screenpop** block. If the connection is successful, the sockets will turn into a solid color and the blue line will connect them. (There are some restrictions on which sockets you can connect together. For example, you cannot connect output of an action to its own input socket or connect two inputs.) If you are not happy with this connection, you can hover over it and double click to remove.

Now we'd like to get the phone number of the customer and use it in **Search and Screenpop**. Here is a tip: if two actions are connected, you can use the return values of the first action in the input fields of the next action. (You can even use the return values of actions connected to the last action, and the ones connected to that, and so on.)

This action has only two options, and we want to use the one called "phone" for this field.

Change type ▾

callType

If you want to enter a custom input value, you can type that, and select **Add New Value** from the dropdown.

And make sure to set **callType** to "inbound." Finally, add the **Start** and **End** nodes and connect everything together.

When you're finished, click **Save** in the sidebar. That's it. You created your first CTI Flow.

To test your flow, go to your **Service Console**, and make a call from a number that is in the profile of a Contact. As the call is displayed in your CCP dashboard, Salesforce will pop open the contact of the caller in a separate tab.

Presence Sync Rules

The CTI Adapter supports bidirectional synchronization of agent state between Amazon Connect and Salesforce Omnichannel. This allows you to tightly control agent availability for different contact/media types dependent on current agent state. This section of the guide assumes that you have Omnichannel configured appropriately. If you do not and wish to test this function, please refer to the section [Configure Salesforce Omnichannel for Testing](#).

NOTE: In order for Presence Sync to work, the CTI Adapter must be configured to allow it. See [CTI Adapter Details](#) for more information.

Presence Sync Rules are evaluated based on specific events. The available events are:

- **Connect Agent State Change:** The Connect agent's state has changed.
- **Salesforce Agent State Change:** The Salesforce agent's state has changed.
- **Salesforce Agent Logout:** The Salesforce agent has logged out.

- **Salesforce Work Accepted:** The Salesforce agent has accepted work.
- **Salesforce Workload Changed:** The Salesforce agent's workload has changed.

Once the event is triggered, the CTI adapter will evaluate the provided criteria. The criteria is established by comparing Operand A, using standard comparator options, against Operand B. Possible options for Operand A and B are:

- **Connect Agent New State:** The Connect agent's new state value
- **Connect Agent Old State:** The Connect agent's old (previous) state value
- **Salesforce Agent New State:** The Salesforce agent's new state value
- **Salesforce Service Channel:** The service channel upon which the Salesforce agent has accepted work
- **Salesforce Previous Workload:** The Salesforce agent's previous workload
- **Salesforce Previous Workload Pct:** The Salesforce agent's previous workload expressed as a percent of configured capacity
- **Salesforce New Workload:** The Salesforce agent's new workload
- **Salesforce New Workload Pct:** The Salesforce agent's new workload expressed as a percent of configured capacity
- **Salesforce Configured Capacity:** The Salesforce agent's configured capacity
- **Static Value:** The user may provide a value. For example, a custom agent state name or other alphanumeric value. When Static Value is selected a "Value" field becomes visible to accept the users static value input.

Available comparators are:

- **Equal to:** Are Operand A and Operand B equal
- **Not equal to:** Are Operand A and Operand B not equal
- **Greater than:** Is Operand A greater than Operand B
- **Greater than or equal to:** Is Operand A greater than or equal to Operand B
- **Less than:** Is Operand A less than Operand B

- **Less than or equal to:** Is Operand A less than or equal to Operand B

Configuring Statuses

Presence Sync Rules require statuses in both Amazon Connect and Salesforce. In this example, we will add two additional statuses to each side of the configuration and prepare rules that sync both clients to the same state regardless of which agent sets the status. Essentially, you will configure the status sync similar to the following example:

| When a sets status to b | Set x to y |
|--|-----------------------------------|
| Amazon Connect sets status to Available | Omnichannel to Available |
| Omnichannel sets status to Available | Amazon Connect to Available |
| Amazon Connect sets status to Working -- Phone | Omnichannel to Working -- Phone |
| Omnichannel sets status to Working -- Media | Amazon Connect to Working - Media |

Amazon Connect System Statuses

The following Amazon Connect CCP statuses are system statuses that can be used in presence sync. Please note however that these statuses are restricted and you cannot set the Amazon Connect status to the below.

- Busy - agent is in a call
- Pending - agent is receiving a request for a queue callback
- PendingBusy - agent is receiving call
- CallingCustomer - agent is calling customer
- AfterCallWork - agent is in the after call work screen

Create Presence Statuses in Amazon Connect

Agents are responsible for setting their status in the Contact Control Panel (CCP). Typically, the only time an agent's status changes is when they manually change it in the CCP however Presence Sync Rules can automate the process when conditions are met.

Amazon Connect provides two default status values:

- Available
- Offline

You can change the name of these values, and you can add new ones. For example, you might add a status for Lunch, and another for Training. These and the default status values will be used for reporting, metrics, and resource management.

Note: When you add a new status, it will always be **Custom**, not routable.

Create an Amazon Connect status

1. Login to your Amazon Connect instance as an Administrator
2. From the left navigation, choose **Users**, then select **Agent status**

3. Select **Add new agent status**

4. Provide a Status name and Description. Leave the Enabled checkbox selected.

| Status name | Description | Type | Enabled for use in CCP |
|-------------|-------------|--------|-------------------------------------|
| Lunch | Lunch | Custom | <input checked="" type="checkbox"/> |

5. Select Save. Repeat as desired for the remaining statuses that you wish to add.

Create Presence Statuses in Salesforce

You will need to configure presence statuses to reflect the different presence states that you wish your Omni-Channel agents to enter. These do not need to match agent statuses in Amazon Connect exactly, but it does make it easier to track what you are doing.

Create a Salesforce presence status

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** field, enter presence and choose **Presence Statuses** from the results

3. In the Presence Statuses page, choose New
4. Provide a status name, for example Lunch
5. Set the Status options appropriately, for example, Busy
 - a. For Online statuses, you will need to provide a channel. Please reference the [Omni-Channel documentation](#) for details
6. Choose Save

Presence Statuses

Let agents indicate when they're online and available to receive work items from a specific service channel, or whether they're away or offline.

[Save](#) [Cancel](#)

Basic Information

| | |
|----------------|------------------------------------|
| Status Name | <input type="text" value="Lunch"/> |
| Developer Name | <input type="text" value="Lunch"/> |

▼ Status Options

Choose whether agents are online or busy when they use this status. Online statuses let agents receive new work items. Busy statuses make them unavailable for new work items.

- Online
 Busy

[Save](#) [Cancel](#)

7. Repeat as necessary for all desired statuses

Configure Enabled Service Presences Status Access in Salesforce

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** field, enter profiles and choose **Profiles** from the results

The screenshot shows the Salesforce Setup interface. The top navigation bar has 'Setup' selected. Below it is a search bar with 'profiles' typed in. Under the 'Users' section, there is a link labeled 'Profiles' which is highlighted with a red box.

3. Select the profile assigned to your users
4. Hover over the Enabled Service Presence Status link and choose Edit

The screenshot shows the 'Profiles' page in Salesforce. At the top left is a user icon and the word 'SETUP'. Below it is a 'Profiles' section header. The main content area is titled 'System Administrator' and contains a paragraph about profile permissions. At the bottom of the page, there is a list of access links, one of which, 'Enabled Service Presence Status Access', is highlighted with a red box. To its right is an 'Edit' button, also highlighted with a red box.

5. Select the available status from the left, then choose the Add button to add it to the Enabled Service Presence Statuses field

Enable Service Presence Status Access

6. Select Save

7. Repeat as necessary for other statuses or profiles.

Configure Presence Sync Rules

The CTI Adapter provides a rules-based presence status synchronization system allowing for flexibility in mapping agent states between Amazon Connect and Salesforce Omni-Channel.

Presence synchronization actions may be configured based upon manual agent state changes (agent goes on break), system agent state changes (answering a call), omnichannel agent work (agent accepts an email), and omnichannel workload changes (agent completes an email) as examples.

As the scope of presence sync rules can vary wildly, this example will show you how to change state based on Amazon Connect agent state change and Salesforce agent state change.

Create a Presence Sync Rule

1. Log in into your Salesforce org and go to the **Service Console**
2. Expand the **navigation menu** by selecting the down arrow and choose **AC CTI Adapters**.

3. Select **ACLightningAdapter**

4. Scroll down to the **Presence Sync Rules** section

5. Select **New** to create a new presence sync rule

6. Provide a **Presence Sync Rule Name** to identify the use case of this rule. For example: Connect agent switches to Lunch

The screenshot shows the 'New AC ...' configuration page for a Presence Sync Rule. At the top, there are tabs for 'ACLightningAda...' and 'New AC ...'. The main area has a heading 'Provide a user friendly name for this presence sync rule and specify if this rule is currently active.' Below this, there's a field labeled 'Presence Sync Rule Name' with the value 'Connect agent switches to Lunch'. Underneath, there's a checkbox labeled 'Active' which is checked. The entire form is contained within a light blue border.

7. Select **Next**

8. For Source, select **Connect Agent State Change**, and select **Next**

9. For Operand A, choose **Connect Agent New State**

10. Set the Comparator to **Equal to**

11. Set Operand B to **Static Value**

12. For Operand B Value, enter **Lunch** (Or whatever state you have created in Amazon Connect)**

Configure the criteria that is evaluated to determine if the rule's action should be applied.

If the expressions configured here evaluates to 'true", the rule's action is applied. If the expression configured here evaluates to 'false', the rule's action is not applied.

* Operand A
Connect Agent New State

* Comparator
Equal to

* Operand B
Static Value

* Operand B Value
Lunch

13. Select **Next**

14. For Destination, choose **Salesforce Agent State**

15. Set the Value to **Lunch** (Or whatever state you have configured in Salesforce) **NOTE:** the static value for Salesforce Omni-Channel status is the Developer Name, not the Status Name

16. Select **Save**.

17. Refresh your browser

18. In the bottom left corner of the Service Console, select the CTI Softphone icon

19. Set your Amazon Connect agent status to Lunch

20. Observe that the Omni-Channel status switches to Lunch

The screenshot shows the Salesforce Omni-Channel interface. At the top, there's a header bar with the 'Omni-Channel' logo and a minimize button. Below it is a dropdown menu showing 'Lunch'. A message bubble says 'You have no active requests.' with a close button. At the bottom, there are two buttons: 'New (0)' and 'My work (0)', with 'New (0)' being underlined.

21. Repeat this process as desired to configure your presence sync rules.

Localization

Prerequisites

CTI Adapter will use Translation Workbench to maintain translated values for metadata and data labels in your Salesforce org. In order for that to work, you need to enable Translation Workbench in your org.

1. From Setup, in the Quick Find box, enter Translation Language Settings, and then select Translation Language Settings.
2. On the welcome page, click Enable.

Setting your preferred language

Starting from v5.6, Amazon Connect Salesforce CTI adapter is localized in nine new languages: Spanish, French, Brazilian Portuguese, Korean, Italian, German, (Simplified/Traditional) Chinese, and Japanese.

Change the language by selecting the username in the top right corner, then click on "My Settings".

On the setting page on the left panel go to "Personal" and then select "Language & Time Zone".

Connections

Grant Account Login Access

Language & Time Zone

Login History

Personal Information

Reset My Security Token

Security Central

Display & Layout

You can then select your preferred language. Note that CTI adapter only have nine languages built within the package.

| | |
|----------------|---|
| Time Zone | (GMT-08:00) Pacific Standard Time (America/Los_Angeles) |
| Locale | English (United States) |
| Language | <input checked="" type="checkbox"/> English Deutsch Español Français Italiano 日本語 Svenska 한국어 中文 (繁體) 中文 (简体) Português (Brasil) Nederlands Dansk ภาษาไทย Suomi Русский Español (México) Norsk (bokmål) |
| Email Encoding | Europe (ISO-8859-1, ISO-LATIN-1) |

Save **Cancel**

Click save and the page will reload. That's it. You can check in other pages to see if it actually applies your change. For example here is a screenshot of CTI Flow Editor in Spanish.

Additional Notes

Please note that not all fields can be localized to different languages due to a couple reasons. Here are places that cannot be localized:

- Dashboard. Salesforce dashboards do not support localization.
- Flexipages. This means the page with tabs that you can find in AC CTI Adapter page in lightning.

| Attributes | CTI Flows | Presence Sync Rules | Features |
|----------------|-----------|---------------------|----------|
| Attributes (0) | | | |

- Reports. This is a missing functionality in Salesforce.

Set Agent Status on Session End

This feature automatically sets the status of the agent to "Offline" — or to any status you choose — when the agent closes all his Salesforce tabs. **Disclaimer:** This feature will popup a window to perform the logout functionality. This window must stay open for the feature to work, but it does not have to be visible (i.e. can be put in the background).

You can configure this feature by heading to the feature panel on your CTI Adapter and clicking new.

Attributes CTI Flows Presence Sync Rules **Features**

Features (0)

New

Then for "AC Feature Name", enter: `SetAgentStatusOnSessionEnd`

New AC Feature

Information

* AC Feature Name

`SetAgentStatusOnSessionEnd`

Value

Active

* CTI Adapter

ACLightningAdapter

You can optionally specify which status the agents should be changed to when they end the session. By default, this is "Offline," but you can configure it using the `Status` setting of the feature.

* AC Feature Name

SetAgentStatusOnSessionEnd

Value

Status:Away

When turned on, the feature will apply to all agents. If you'd rather have it apply to a small subset, you can configure `IfProfileNameIncludes` setting.

* AC Feature Name

SetAgentStatusOnSessionEnd

Value

Status:Away

IfProfileNameIncludes:On-Call

Now only the agents that have "On-Call" in their Connect routing profile name will be shown as "Offline" when they end their session. This setting can accept multiple, comma-separated profile names, as well.

You can also have the Status be set to `Logout`, which will append the functionality of the logout feature mentioned [here](#) - logging the agent out of the CCP upon session ending. It will not log the user out if a call is ongoing.

When your agents log back in, they will be shown as "Available" by default. If you'd like to control which status to set your agents, you can configure it with `InitialAgentState` setting.

Note that this feature does not work with Salesforce Pop-Out utilities. This means that it won't be working if CCP is popped out from utility bar. This is because the pop-out window is a different window

managed by Salesforce and we are not able to track any session on that window.

Contact Lens

CTI Adapter now gives you access to your post-call Contact Lens data on your Salesforce instance. To configure this feature, you must have installed and configured the AWS Serverless application.

Three or four minutes after the call, a new Contact Channel Analytics record is created with the recording url with only the call recording. In another three minutes, this record is updated with Contact Lens recording, transcript and other metadata.

The new record is also associated automatically with a Case and Contact through their Amazon Connect contact id. This means that you will be able to configure your case record page with a related list that lists all the calls related to a case.

Configuring Related Transcripts List for Case Object

1. Go to the "Setup" section.
2. Search for "Object Manager" in Quick Find.
3. Go into "AC Contact Channel Analytics" object.
4. Click on "Fields & Relationships"
5. Select the "Case" field.
6. Click on "Set Field-Level Security" button.
7. In the "Field-Level Security for Profile" panel, select "Visible" for all the profiles where this field should appear.
8. Click "Save"

9. Click "View Field Accessibility" button.

10. Select "Case" field from "Field accessibility for Field" dropdown.

11. Select the profile for which you want to enable this field.

12. Mark "Field-Level Security" of the field as "Visible" and save.

13. Go to a Case record page.

14. Click on "Edit Page" under the gear button on upper right corner of the page.

15. Select "Related List - Single" from left sidebar, and drop it into "Related" section.

16. Click on the item you just dropped to focus on it.

17. In the right sidebar, select "Case Layout (previewed)"

18. Click on "Related Lists" and find "Transcripts" field in the panel.

19. Drag "Transcripts" into the "Related Lists" section on the body of the page.

20. Click "Save" and return to the page editor.

21. Focus on the item you dropped in step 15 again.

22. In the right sidebar, under the "Related List" dropdown, find and select "Transcripts" field.

23. Click "Save" to save the page layout.

24. Click "Activation..."

25. Go into "App Default." Click on "Assign as App Default."

Set this page as the default for Case records for specific Lightning apps. An app default page displays for all specific app, record type, and profile assignments are made.

[Assign as App Default](#)

26. Select the apps you'd like the related list to appear. Click "Next" twice, and then finally click "Save."

Now your related transcripts should appear on the Case record page.

Whenever you update the Amazon Connect contact id of this case, the related list will be updated to associate the transcripts associated with your contact.

Follow the same steps above for Contact.

CTI Actions

Customers can now extend their Contact Control Panel (CCP) with customizable buttons called CTI Actions. These buttons can be configured in Salesforce and used to simplify common agent actions. For example, you can add a button that transfers calls to a manager, start and stop recordings, automate case creation, or start a customer refund process. CTI Actions are configured in the CTI Adapter's Actions Admin panel to execute [CTI Flows](#) which are process blocks that enable you to easily design agent workflows within our Salesforce integration.

You can configure a CTI Action in the CCP Element Editor page.

**Actions****Step 1: Name and Flow****Save**

Quick Save

Delete

Cancel

Step 2: Payload

(optional)

Step 3: Additional Data

(optional)

This section asks you for some required information about your action. It is the only required section you need to fill to create an action.

Action Name
Leave Voicemail

The name agents will see.

CTI Flow
Leave a VoicemailIn this field, you will see all CTI Flows in this account whose source field is [CCP Overlay](#).**Order**
0

Position of the action in the overlay.

Make sure that you have created a CTI Flow and it uses the source "CTI Action." Only these CTI Flows will be displayed in the dropdown field.

You can optionally specify a payload to pass to the CTI Flow. This allows your agents to enter additional data about the customer or information about the call to pass into the CTI Flow. The CCP Element Editor gives you the ability to add input fields into your form.

Actions

| | |
|------------------------------------|---|
| Step 1: Name and Flow | Save Quick Save Delete Cancel |
| Step 2: Payload (optional) | In this section, you will build a form that will be displayed to the agents prior to triggering the CTI Flow. The form data will be passed as a payload to the executed flow. |
| Step 3: Additional Data (optional) | Overview Form fields New field + |

This section collects some basic information about the form, such as title and instructions. Both fields are optional.

(optional)

Title
Enter a short title for the form.

(optional)

Instructions
Enter a few lines about how to fill out this form.

Add a field

Upgrading from an earlier version

If you are upgrading the Salesforce package from an earlier version of CTI Adapter, there are a few additional steps to follow:

1. Go to Setup
2. In "Quick Find," search for "Picklist Value Sets" and click on the result.
3. Select "AC_CtiScriptSource" on "Picklist Value Sets" page.
4. Scroll down to "Values" section
5. Click "New" to add a new value.
6. In the textarea, enter "ctiAction" and save
7. Scroll down to the new field you added, "ctiAction," and click "Edit."
8. Update the label to "CTI Action" and save.

Recording Controls

Recording Controls panel in the CCP Overlay allows your agents to control the recording behavior of the call.

Start recording

Pause recording

This panel integrates to Amazon Connect [call recording API](#). To use it, make sure to add [Set recording behavior block](#) in your Contact Flow. The controls will be activated during a call.

This can be useful when you don't want to record every call, and give the agent the ability to pause and resume a recording.

Note that once a recording is stopped, it cannot be restarted. After starting a recording, you should use pause/resume button to control it.

This panel is disabled by default. You can enable it by adding `FEATURE_RECORDING_PANEL` feature flag to your CTI Adapter, with the setting `Enabled:true`.

Setup

First, create an IAM user and give it the managed policy `AmazonConnect_FullAccess`.

The screenshot shows the AWS IAM console. The top navigation bar has tabs for **Permissions**, **Groups**, **Tags**, and **Security credentials**. The **Permissions** tab is selected. Below the tabs, a section titled **▼ Permissions policies (1 policy applied)** is shown. A blue button labeled **Add permissions** is visible. Under the policy list, there is a row for **Policy name ▾** which is expanded to show **Attached directly**. A list item shows a yellow cube icon followed by the policy name **AmazonConnect_FullAccess**, which is highlighted with a blue background.

Copy the access key and secret of this user (from the "Security credentials" tab.) Next, go to your Salesforce instance Setup section. Search for Named Credentials in the left sidebar, and create a new credential named `AmazonConnectAPI`. (The name and the label should be identical.)

Named Credential Edit: AmazonConnectAPI

Specify the callout endpoint's URL and the authentication settings that are required for

The screenshot shows the 'Named Credential Edit' interface. At the top right are 'Save' and 'Cancel' buttons. Below them are three fields: 'Label' (AmazonConnectAPI), 'Name' (AmazonConnectAPI), and 'URL' (https://connect.us-east-1.amazonaws.com). A section titled 'Authentication' is expanded, showing fields for 'Certificate' (with a browse icon), 'Identity Type' (Named Principal), 'Authentication Protocol' (AWS Signature Version 4), 'AWS Access Key ID' (AKIAUYVLTXECVPW5), 'AWS Secret Access Key' (redacted), 'AWS Region' (us-east-1), and 'AWS Service' (connect).

| | |
|-------------------------|---|
| Label | AmazonConnectAPI |
| Name | AmazonConnectAPI |
| URL | https://connect.us-east-1.amazonaws.com |
| Authentication | |
| Certificate | [Browse] |
| Identity Type | Named Principal |
| Authentication Protocol | AWS Signature Version 4 |
| AWS Access Key ID | AKIAUYVLTXECVPW5 |
| AWS Secret Access Key | [Redacted] |
| AWS Region | us-east-1 |
| AWS Service | connect |

Fill in https://connect.us-east-1.amazonaws.com as the url. For Identity Type, select "Named Principal" and for "Authentication Protocol" select "AWS Signature Version 4." Then fill in the "AWS Access Key Id" and "AWS Access Secret" fields with your IAM user credentials. And for AWS Region, use the region of your Connect instance. And for the AWS Service, fill in connect .

Voicemail Drops

You can find the complete documentation for this feature [in this pdf](#).

Accessing the Salesforce API from Amazon Connect Contact Flows Using AWS Lambda

The most commonly used feature of the AWS Serverless Application Repository for Salesforce is accessing/updating Salesforce data using the `sflInvokeAPI` Lambda function. This function allows an Amazon Connect contact flow to perform the following operations against your Salesforce org:

- **Lookup:** queries Salesforce for objects based on the parameters passed to it
- **Create:** creates a Salesforce object based on the parameters passed to it
- **Update:** updates a Salesforce object based on the parameters passed to it
- **Phone Lookup:** uses Salesforce Object Search Language (SOLS) to construct text-based search queries against the search index, which gives significant performance improvement when searching phone number fields.
- **Delete:** deletes a Salesforce object based on the parameters passed to it
- **Query:** executes a Salesforce Object Query Language (SOQL) query on the Salesforce instance. Can return multiple entries.
- **QueryOne:** executes a Salesforce Object Query Language (SOQL) query on the Salesforce instance. Returns result only when one entry is returned from the query.
- **CreateChatterPost:** creates a chatter post.
- **CreateChatterComment:** creates a chatter comment.
- **Search:** performs a search against the Salesforce instance, returning all results.
- **SearchOne:** performs a search against the Salesforce instance, returning at most one result.

NOTE: naming of the Lambda function will vary based on template data, but `sflInvokeAPI` will always be a part of the name.

When you invoke this Lambda function from your contact flows, you will need to pass along parameters that inform the function as to which Salesforce operation you wish to execute, as well as pass along any

required parameters. Depending on your use case, this can require reference to the [Salesforce REST API](#) or the [Salesforce Connect REST API](#) documentation. The core parameters are:

- **sf_operation:** specifies which operation to run. Options are lookup, create, update, phoneLookup, query, queryOne, createChatterPost, createChatterComment
- **sf_object:** defines what type of object you are referencing. Examples include Case, Contact, Task, etc.
- **sf_fields:** the fields you want to receive back from Salesforce when an operation completes successfully
- **sf_id:** the unique identifier for a Salesforce object. Typically used in update operations
- **sf_phone:** contains the phone number used to search when performing a phone lookup

Salesforce Lookup

This operation is invoked by setting **sf_operation** to **lookup**. In this case, the Lambda function queries Salesforce for objects based on the parameters passed to it. For lookup, the following parameters are required:

- sf_object
- sf_fields

Any additional parameters passed will be evaluated as conditional arguments for the lookup.

Note that this operation only returns the first item of the query results. If you want to have all results returned from Salesforce, set **sf_operation** to **lookup_all**.

In the contact flow example below, we are looking for a specific case based on customer input.

Invoke AWS Lambda function

Makes a call to AWS Lambda, and optionally returns key / value pairs.

  "sf_count": 1  
}
```

Salesforce Create

This operation is invoked by setting **sf_operation** to **create**. In this case, the Lambda function creates a Salesforce object based on the parameters passed to it. For create, the following parameters are required:

- sf_object
- Specify additional parameters for the Salesforce object to be created. Please be sure to include all parameters required to create the Salesforce object.

In the contact flow example below, we are creating a new case based on customer input.

This operation returns a response of:

```
{  
    "Id": "5006g00000BLqurAAD"  
}
```

Salesforce Update

This operation is invoked by setting **sf_operation** to **update**. In this case, the Lambda function updates a Salesforce object based on the parameters passed to it. For update, the following parameters are required:

- **sf_object**
- **sf_id**
- Specify additional parameters for the Salesforce object to be created. Please be sure to include all parameters required to create the Salesforce object.

In the contact flow example below, we are updating a specific case.

Invoke AWS Lambda function

Makes a call to AWS Lambda, and optionally returns key / value pairs.

The returned key value pairs can be used to set contact attributes.

Salesforce query

This operation is invoked by setting **sf_operation** to **query**. In this case, the Lambda function uses Salesforce Object Query Language (SOQL) to conduct a query against the Salesforce instance. For query, the following parameter is required:

- query

Any additional parameters will replace text values in the original query so that queries can be dynamic based on values stored within the contact flow. For example, the parameter set:

- query: "select field from object"
- field: "Id"
- object: "Task"

Will result in the query: "select Id from Task".

In the contact flow example below, we look for a customer by phone number.

    ],  
    "sf_count": 1  
}
```

Salesforce queryOne

This operation is invoked by setting **sf_operation** to **queryOne** (case sensitive). In this case, the Lambda function uses Salesforce Object Query Language (SOQL) to conduct a query against the Salesforce instance, returning a result only when one record is returned from the query. For query, the following parameter is required:

- query

Any additional parameters will replace text values in the original query so that queries can be dynamic based on values stored within the contact flow. For example, the parameter set:

- query: "select field from object"
- field: "Id"
- object: "Task"

Will result in the query: "select Id from Task".

```

Salesforce createChatterPost

This operation is invoked by setting **sf_operation** to **createChatterPost** (case sensitive). In this case, the Lambda function uses the Salesforce Connect REST API to create a chatter post (see [here](#)). For createChatterPost, the following parameters are required:

- sf_feedElementType
- sf_subjectId
- sf_messageType
- sf_message

The following parameter is optional:

- sf_mention

(refer to the api reference for value types)

Any additional parameters will replace text values in the sf_message so that messages can be dynamic based on values stored within the contact flow. For example, the parameter set:

- sf_message: "Please help me with case `caseId` "
- caseId: 1234

Will result in the message: "Please help me with case 1234".

In the contact flow example below, we leave a chatter post on a contact.

Salesforce createChatterComment

This operation is invoked by setting **sf_operation** to **createChatterComment** (case sensitive). In this case, the Lambda function uses the Salesforce Connect REST to create a chatter comment (see [here](#)). For createChatterComment, the following parameters are required:

- sf_feedElementId
- sf_commentType
- sf_commentMessage

(refer to the api reference for value types)

Any additional parameters will replace text values in the sf_commentMessage so that messages can be dynamic based on values stored within the contact flow. For example, the parameter set:

- sf_commentMessage: "Please help me with case `caseId`"
- caseld: 1234

In the contact flow example below, we leave a comment on a chatter post.

Salesforce search

This operation is invoked by setting **sf_operation** to **search** (case sensitive). In this case, the Lambda function uses the Salesforce REST to perform a parameterized search (see [here](#)). For search, the following parameters are required:

- q
- sf_fields
- sf_object

The following parameters are optional:

- where
- overallLimit

(refer to the api reference for value types)

See the below example:

Use text X

Destination key

}
```

Amazon Connect Historical Metrics in Salesforce

Amazon Connect can generate a number of historical metric reports to monitor efficiency and utilization, agent performance, and other information about your contact center. Amazon Connect provides you the ability to schedule execution and export of reports, in comma separated value (CSV) format, to the S3 bucket of your choice. This enables broad compatibility across many analytics and WFM tools.

With the AWS Serverless Repository for Salesforce, you can configure the automatic import of reporting data from Amazon Connect into Salesforce. Two different historical reports are available to transport Agent and Queue interval data from Amazon Connect to Salesforce. Once these have been configured and scheduled, you will begin to see data available in the reports that have been included with the CTI Adapter.

Configuring the AWS Services

When you configure schedule reports to run in Amazon Connect, they are saved to your reporting Amazon S3 bucket upon execution. As a part of the schedule configuration, you can determine the frequency with which data is exported. The standard configuration is for execution every 30 minutes; however you can increase the interval time to suit your requirements.

Once you have the reports configured and scheduled, you will then need to activate the trigger for the reports bucket that will invoke an AWS Lambda function included in the AWS Serverless Repository for Salesforce. This function will process the report and import the data to Salesforce.

Configuring the Historical Reports in Amazon Connect

1. Login to your Amazon Connect instance as an Administrator
2. From the left navigation, choose **Metrics and Quality** then select **Historical metrics**

3. On the **Historical metrics** page, select Contact metrics

Historical metrics

Select the type of report and metrics you would like to view.

| | | |
|---------------|-------------------|--|
| Queues | Contact metrics | |
| Agents | Agent performance | |
| Phone numbers | Contact metrics | |

4. Once the **Historical metrics: Queues** report loads, select the cog in the upper right to edit the report

5. On the **Interval & Time** range tab, set the parameters as follows:

a. Interval: 30 minutes

b. Time Zone: UTC

c. Time Range: Last 24 Hours

6. Leave the **Groupings** and **Filters** tabs set to their defaults

7. Select the **Metrics** Tab.

8. Select ALL selectable options EXCEPT:

- a. Callback contacts handled
- b. API contact handled
- c. Callback Contacts
- d. API Contacts
- e. Contacts answered in 25 seconds
- f. Contacts transferred out internal
- g. Contacts transferred out external

9. Select **Apply**

- 10. Once the report saves, select the dropdown menu next to the Save button and choose Schedule
- 11. Set the name as **sfIntervalQueue** and choose **Continue**
- 12. On the **Note** screen, choose **Continue**
- 13. On the **Recurrence** tab in the Schedule Report setup, set the options as:
 - a. Generate this report: Hourly
 - b. Every: 0.5 hour(s)
 - c. Starting at: 1AM
 - d. For the Previous: 0.5 hour(s)

17. Choose **Create**

18. Once the report is created, from the left navigation, choose **Metrics and Quality** then select **Historical metrics**

19. On the **Historical metrics** page, select **Agent performance

Historical metrics

Select the type of report and metrics you would like to view.

The screenshot shows the 'Historical metrics' interface. It has three main tabs: 'Queues' (selected), 'Agents' (highlighted with a red box), and 'Phone numbers'. Under each tab, there are two sub-options: 'Contact metrics' and 'Agent performance' (which is highlighted with a red box). There are also dropdown arrows on the right of each row.

20. Once the **Historical metrics: Agents** report loads, select the cog in the upper right to edit the report

21. On the **Interval & Time** range tab, set the parameters as follows:

a. Interval: 30 minutes

b. Time Zone: UTC

c. Time Range: Last 24 Hours

22. Leave the **Groupings** and **Filters** tabs set to their defaults

23. Select the **Metrics** Tab.

24. Select ONLY the following metrics (deselect any others):

- After contact work time

- Agent on contact time
- Agent idle time
- Non-Productive Time
- Average after contact work time
- Average handle time
- Average customer hold time
- Average agent interaction and customer hold time
- Average agent interaction time
- Contacts agent hung up first
- Contacts consulted
- Contacts handled
- Contacts handled incoming
- Contacts handled outbound
- Contacts put on hold
- Contacts hold disconnect
- Contacts transferred out
- Contacts transferred out internal
- Contacts transferred out external
- Error status time
- Agent answer rate
- Agent non-response
- Occupancy
- Online time

- Agent interaction and hold time
- Agent interaction time
- Average outbound agent interaction time
- Average outbound after contact work time

25. Select **Apply**

26. Once the report saves, select the dropdown menu next to the Save button and choose Schedule

27. Set the name as **sflIntervalAgent** and choose **Continue**

28. On the **Note** screen, choose **Continue**

29. On the **Recurrence** tab in the Schedule Report setup, set the options as:

a. Generate this report: Hourly

b. Every: 0.5 hour(s)

c. Starting at: 1AM

33. Choose **Create**

Once you have created the two reports and set their schedule, the next thing you will need to do is to configure a trigger that executes a Lambda function when the report is generated and stored in S3.

Creating the AWS Lambda Trigger for the Queue Data

1. In a new browser tab, login to the [AWS console](#)
2. Open the [AWS Lambda Console](#)
3. In the Add filter field of the AWS Lambda console, enter sfIntervalQueue and press enter to filter the list of functions
4. Select the Lambda function that includes sfIntervalQueue in the name
5. Expand the Designer section
6. Select Add trigger

▼ Designer

[Go back to application serverlessrepo-AmazonConnectSalesforceLambda](#)

7. In Trigger configuration, select S3 from the dropdown list

[Lambda](#) > [Add trigger](#)

Add trigger

Trigger configuration

Select a trigger

DynamoDB

aws database nosql

Kinesis

analytics aws streaming

S3

aws storage

S3

SNS

aws messaging notifications pub-sub push

SQS

aws queue

8. Referring to the notes from the report configuration earlier, select the appropriate bucket

9. Change the Event type to PUT

10. Referring to the notes from the report configuration earlier, set the Prefix to the path value for your report

11. Set the Suffix to .csv

12. The trigger configuration should now be similar to the following:

Add trigger

Trigger configuration

 S3
aws storage

Bucket
Please select the S3 bucket that serves as the event source. The bucket must be in the same region as the function.
connect-[REDACTED]

Event type
Select the events that you want to have trigger the Lambda function. You can optionally set up a prefix or suffix for an event. However, for each bucket, individual events cannot have multiple configurations with overlapping prefixes or suffixes that could match the same object key.
PUT

Prefix - optional
Enter a single optional prefix to limit the notifications to objects with keys that start with matching characters.
connect/sfctifinal022020/Reports/SFDC/Queue/

Suffix - optional
Enter a single optional suffix to limit the notifications to objects with keys that end with matching characters.
.csv

Lambda will add the necessary permissions for Amazon S3 to invoke your Lambda function from this trigger. [Learn more](#) about the Lambda permissions model.

Enable trigger
Enable the trigger now, or create it in a disabled state for testing (recommended).

13. Select **Add**

14. If everything has been configured correctly, you should receive a success message.

Creating the AWS Lambda Trigger for the Agent Data

1. In a new browser tab, login to the [AWS console](#)

2. Open the [AWS Lambda Console](#)

3. In the Add filter field of the AWS Lambda console, enter sflIntervalAgent and press enter to filter the list of functions
4. Select the Lambda function that includes sflIntervalAgent in the name
5. Expand the Designer section
6. Select Add trigger

The screenshot shows the AWS Lambda Configuration page. At the top, there are three tabs: Configuration (highlighted in orange), Permissions, and Monitoring. Below the tabs, a section titled "Designer" is expanded, indicated by a downward arrow icon. A blue link "Go back to application serverlessrepo-AmazonConnectSalesforceLambda" is visible. On the left, a red box highlights the "Add trigger" button, which has a plus sign icon and the text "Add trigger". On the right, there is a Lambda function card with the name "serverlessrepo-Am" and "ntervalQueue-3ZN", and a "Layers" section with a stack icon.

7. In Trigger configuration, select S3 from the dropdown list

Add trigger

Trigger configuration

Select a trigger

DynamoDB

aws database nosql

SQS

aws queue

8. Referring to the notes from the report configuration earlier, select the appropriate bucket

9. Change the Event type to PUT

10. Referring to the notes from the report configuration earlier, set the Prefix to the path value for your report

11. Set the Suffix to .csv

12. The trigger configuration should now be similar to the following:

Add trigger

Trigger configuration

S3

aws storage

Bucket

Please select the S3 bucket that serves as the event source. The bucket must be in the same region as the function.

connect-[REDACTED]

Event type

Select the events that you want to have trigger the Lambda function. You can optionally set up a prefix or suffix for an event. However, for each bucket, individual events cannot have multiple configurations with overlapping prefixes or suffixes that could match the same object key.

PUT

Prefix - optional

Enter a single optional prefix to limit the notifications to objects with keys that start with matching characters.

connect/sfctifinal022020/Reports/SFDC/Agent/

Suffix - optional

Enter a single optional suffix to limit the notifications to objects with keys that end with matching characters.

.csv

Lambda will add the necessary permissions for Amazon S3 to invoke your Lambda function from this trigger. [Learn more](#) about the Lambda permissions model.

Enable trigger

Enable the trigger now, or create it in a disabled state for testing (recommended).

[Cancel](#)[Add](#)

13. Select **Add**

14. If everything has been configured correctly, you should receive a success message.

Verifying the Data Import in Salesforce

Once you have configured the reports and added the triggers, you should start to see data in Salesforce after ~30 minutes. The Amazon Connect CTI Adapter comes with a predefined set of reports. These reports can be customized and additional reports can be created by leveraging the imported data.

Viewing Amazon Connect Reports in Salesforce

1. Log in into your Salesforce org and go to the **Service Console**

2. Expand the **navigation menu** by selecting the down arrow and choose **Reports**

3. In the left Navigation, select **All Folders**

4. Select the **Amazon Connect Reports** folder

The screenshot shows the AWS Service Console interface. At the top, there's a navigation bar with icons for Home, Service Catalog, Lambda, and a dropdown for Reports. Below this is a sidebar titled 'Reports' with 'All Folders' selected. A sub-header indicates '1 item'. The main content area has a table with columns 'REPORTS' and 'Name'. Under 'Recent', the 'Amazon Connect Reports' folder is listed and highlighted with a red box.

| REPORTS | Name |
|---------------|------------------------|
| Recent | Amazon Connect Reports |
| Created by Me | |

5. In the list of reports, choose Average Handle Time queue report

The screenshot shows the 'All Folders > Amazon Connect Reports' view. The sidebar lists categories like 'Recent', 'Created by Me', 'Private Reports', 'Public Reports', and 'All Reports'. The main area displays a table of reports with columns 'Name', 'Description', and 'Folder'. The 'Average Handle Time' report is highlighted with a red box.

| REPORTS | Name | Description | Folder |
|-----------------|----------------------------------|-------------|------------------------|
| Recent | Average Queue Abandon Time | QUEUES | Amazon Connect Reports |
| Created by Me | Average Occupancy Today | | Amazon Connect Reports |
| Private Reports | Average Handle Time | QUEUES | Amazon Connect Reports |
| Public Reports | Average Handle Time Today | | Amazon Connect Reports |
| All Reports | Agent Performance (Current User) | | Amazon Connect Reports |

6. Once the report loads, you should see data (provided calls have queued in this Amazon Connect instance today)

Amazon Connect Real-Time Metrics in Salesforce

The CTI adapter includes real-time reporting tools which provide visibility into critical data which help improve the utilization of your agents and allows insight into overall queue performance. Once you have deployed the AWS Serverless Application Repository for Salesforce your Amazon Connect instance will push real-time metric data to Salesforce every 15 seconds. This data can be viewed from two tools that were included with the CTI Adapter installation.

The first view, AC Queue Metrics queue provides details about current queue staffing and the distribution of contacts by queue. The second view, AC Real Time Queue Metrics, allows you to select a specific queue and view the real-time metrics for that queue.

Deployment and Configuration

Once you have deployed the AWS Serverless Application Repository for Salesforce and provided the appropriate credentials, there is no further configuration required to make the data flow work. The only remaining task is to add the real-time views to your Salesforce console.

Adding Real-Time Reports to the Service Console

1. Log in into your Salesforce org and go to the **Service Console**
2. Expand the **navigation menu** by selecting the down arrow and choose **Edit**.

3. On the Edit Service Console App Navigation Items page, select **Add More Items**

Edit Service Console App Navigation Items

Personalize your nav bar for this app. Reorder items, and rename or remove items you've added.

[Learn More](#) ⓘ

NAVIGATION ITEMS (7)

[Add More Items](#)

4. Select the + next to **AC Queue Metrics** and **AC Real Time Queue Metrics**

5. Select **Add 2 Nav Items**

6. Change the order of your Navigation Items if desired, then choose **Save**

Edit Service Console App Navigation Items

Personalize your nav bar for this app. Reorder items, and rename or remove items you've added.

[Learn More](#) ⓘ

ⓘ 2 items added to your list. Save your updates.

☰  Chatter

☰  Home

☰  AC Queue Metrics

X

☰  AC Real Time Queue Metrics

X

[Reset Navigation to Default](#) ⓘ

[Cancel](#)

[Save](#)

7. Once the save completes, expand the **navigation menu** by selecting the down arrow and choose

AC Queue Metrics

The screenshot shows the Service Console interface. At the top, there's a navigation bar with 'Service Console' and 'AC CTI Adapters'. Below it is a sidebar titled 'AC CTI Adapters Recently Viewed' which lists 'CTI Adapter' and 'ACLightning'. The main content area shows a list of options under 'AC CTI Adapters': 'AC Queue Metrics' (highlighted with a red box), 'AC Real Time Queue Metrics', 'Cases', 'Contacts', 'Accounts', and 'Reports'.

8. The AC Queue Metrics view will display and any relevant data will update every 15 seconds.

The screenshot shows the 'AC Queue Metrics' view. At the top, there's a header with 'AC Queue Metrics'. Below it is a section titled 'Real Time Metrics' with a subtitle 'Live Queue Data'. A table displays the following data for 'BasicQueue': Agents Available: 1, Agents Error: 0, Agents Non Productive: 0, Agents Online: 2, Agents Staffed: 2, Agents After Contact Work: 0, Contacts In Queue: 0, Contacts Scheduled: 0, Oldest Contact Age: 0.

9. Scroll down to view the **AC Contact Metrics Dashboard

The screenshot shows the 'AC Contact Metrics' dashboard. It features eight cards arranged in a grid:

- Contacts Incoming:** Sum of Contacts Incoming: 4. BasicQueue: 4.
- Contacts Queued:** Sum of Contacts queued: 4. BasicQueue: 4.
- Contacts Handled Incoming:** Sum of Contacts handled incoming: 4 (100% of 4). BasicQueue: 4.
- Contacts Abandoned:** Sum of Contacts abandoned: 0. BasicQueue: 0.
- Average Queue Abandon Time:** Sum of Average queue abandon time: 0. BasicQueue: 0.
- Average Handle Time:** Sum of Average handle time: 18. BasicQueue: 18.
- Contact Handle Time:** Sum of Contact handle time: 75. BasicQueue: 75.
- Average Service Level 120 Seconds:** Average Service level 120 seconds: 100%. BasicQueue: 100%.

Each card has a 'View Report' link below it.

10. Expand the **navigation menu** by selecting the down arrow and choose **AC Real Time Queue Metrics

Service Console

AC Queue Metrics

The screenshot shows the Service Console interface. At the top, there's a navigation bar with icons and text. Below it, a sidebar on the left has a title 'AC Queue' and a section 'Real Time Live Queue Data'. Under 'Queue Name', 'BasicQueue' is listed. On the right, a dropdown menu titled 'AC Queue Metrics' is open, listing several options: 'AC CTI Adapters', 'AC Queue Metrics', 'AC Real Time Queue Metrics' (which is highlighted with a red box), 'Cases', 'Contacts', 'Accounts', and 'Reports'. A vertical scrollbar is visible on the right side of the dropdown menu.

11. Change the List View to **ALL**

The screenshot shows the 'AC Real Time Queue Metrics' list view. At the top, there's a header with a monitor icon, the title, and a dropdown set to 'All'. Below the header, a table lists items: '1 item' followed by 'LIST VIEWS' and a single entry 'All' which is checked. At the bottom, there's a note '1 Recently Viewed (Pinned list)'. The 'All' entry is highlighted with a red box.

12. Select a queue to view the detailed real-time statistics for that specific queue

Contact Channel Analytics

In addition to the CTI adapter's native ability to provide direct playback links to call recordings in Amazon Connect, the AWS Serverless Application Repository for Salesforce includes several functions that allow you to process recordings, perform quality analytics functions, and bring data into Salesforce.

This processing is done post-call, using the Contact Trace Record (CTR) as the initiation path. The following quality analytics options are available:

- **Call Recording Streaming:** streams the actual audio file into Salesforce. This option is not mandatory for the others to function.
- **Recording Transcript:** you can choose to have your call recordings transcribed to text and presented in a visual format that resembles a chat conversation. This allows for quick scanning of a call to identify key segments of conversation. This option is required if you wish to include the next level of analysis
- **AI-Driven Contact Analysis:** once the recordings have been transcribed to text, you can also indicate that you wish to do further analysis of the conversation using [Amazon Comprehend](#). Available options are:

- **Sentiment Analysis:** returns the overall sentiment of the conversation (Positive, Negative, Neutral, or Mixed).
- **Keyphrase Extraction:** returns the key phrases or talking points and a confidence score to support that this is a key phrase.
- **Language Detection:** returns the dominant language with a confidence score to support that a language is dominant
- **Custom Entities:** allows you to customize the AI to identify terms that are specific to your domain
- **Syntax Analysis:** analyze the transcript using tokenization and Parts of Speech (PoS), and identify word boundaries and labels like nouns and adjectives within the text.

Call Recording Streaming

You can stream Call Recordings in your Salesforce Org. This allows for easy access to the recordings from within Salesforce and can be used in conjunction with the other contact channel analytics features to provide a complete view of the customer interaction.

The import of call recordings is not required to activate the other contact channel analytics features.

Once enabled during the AWS Serverless Application Repository for Salesforce, recording import is activated on a call by call basis by adding a specific contact attribute. This attribute is used during Contact Trace Record processing to trigger the call import.

NOTE: After Call Work time is a part of the Contact Trace Record. As such, CTRs are not generated until the agent leaves the after call work state. If you are not seeing a recording import, please make sure the agent has completed the call and left the after call work state.

Prerequisite Setup

Cloudformation Template

To make sure that the AWS resources are set up, make sure that the *PostcallRecordingImportEnabled* parameter is set to true in your Cloudformation stack:

The screenshot shows the AWS CloudFormation console with the 'Parameters' tab selected. A search bar at the top right is empty. Below it is a table with two columns: 'Key' and 'Value'. The 'Key' column lists various parameters such as 'AmazonConnectInstanceId', 'AmazonConnectQueueMaxRecords', etc. The 'Value' column shows their corresponding values. The row for 'PostcallRecordingImportEnabled' has its entire row highlighted with a red box. The 'Value' for this parameter is 'true'.

AWS Side Setup

1. See [these steps](#). Follow the sections *Creating key pairs for your signers*, and *Adding a signer to a distribution*. Make sure to record the **public key ID**.
2. Copy and paste the contents of the private key .pem file into a text editor. Replace every newline character with a space, and then delete the last character. This is most easily done using a "find and replace" feature in your text editor. The resulting string of text should resemble the following:

```
-----BEGIN RSA PRIVATE KEY----- (64 character string) (64 character string)
(64 character string) (64 character string) (64 character string) (64
character string) (64 character string) (64 character string) (64 character
string) (64 character string) (64 character string) (64 character string)
(64 character string) (64 character string) (64 character string) (64 character
string) (64 character string) (64 character string) (64 character string)
(64 character string) (64 character string) (under 64 character string) ---
--END RSA PRIVATE KEY-----
```

3. Navigate to the "Secrets Manager" service. Select the **SalesforceCredentials**.
4. Under the "Secret value" tab, select "Retrieve secret value" and then "Edit".
5. For the **CloudFrontPrivateKey** field, copy and paste the modified contents of the private key .pem file. For the **CloudFrontAccessKeyId** field, copy and paste the **Access Key Id** you recorded above. Your Secrets Manager Secret should look like the following:

SalesforceCredentials

Secret details

Encryption key
aws/secretsmanager

Secret name
SalesforceCredentials

Secret ARN
[REDACTED]

Secret description
-

Tags

Secret value Info
Retrieve and view the secret value.

Secret key/value **Plaintext**

```
{
  "CloudFrontPrivateKey": "-----BEGIN RSA PRIVATE KEY-----  
[REDACTED]  
-----END RSA PRIVATE KEY-----",
  "CloudFrontAccessKeyId": [REDACTED]
}
```

Please note that your secret may also be formatted stored as a "Secret key/value" secret rather than a "Plaintext" secret; both secret types are valid.

6. Navigate to your Salesforce instance. Navigate to setup, then search for "Visualforce pages."

The screenshot shows the Salesforce setup interface for Visualforce Pages. In the left sidebar, under 'Visualforce Components', 'Visualforce Pages' is selected. A search bar at the top left contains the query 'visualfor'. On the right, the 'AC_RecordingViewer' page detail is displayed. The page has a label 'AC_RecordingViewer' and a namespace prefix 'AC'. There are buttons for 'Edit', 'Delete', 'Clone', 'Where is this used?', 'Show Dependencies', and 'Preview'.

7. Select the **AC_RecordingViewer** visualforce page, and select "preview." Copy the url of the opened page up until `.com`. Make sure not to include any characters after `.com`.

8. Navigate back to aws, to the s3 bucket where your audio recording files are stored. This s3 bucket should be the same bucket as the **ConnectRecordingS3BucketName** parameter to the serverless application.

9. In the bucket details, select the **Permissions** tab and then the **CORS configuration** tab and paste the following. Replace the AllowedOrigin with the url copied in step 9.

```
[
  {
    "AllowedHeaders": ["Access-Control-Allow-Origin"],
    "AllowedMethods": ["GET"],
    "AllowedOrigins": ["'{url copied in step 9}'"],
```

```
"ExposeHeaders": []  
}  
]
```

Cross-origin resource sharing (CORS)

Salesforce Side Setup

1. In Salesforce Setup, search for "Named Credentials." Select **New Named Credential**.
2. For the **Name** and **Label**, enter AwsGenerateAudioRecordingURL.
3. In the **URL** section, enter `https://lambda.{awsRegion}.amazonaws.com/2015-03-31/functions/{lambdaFunctionName}/invocations/` -- replace {awsRegion} with the awsRegion your serverless application resides in (for example, us-east-1), and replace {lambdaFunctionName} with the full name of the sfGenerateAudioRecordingStreaming lambda you recorded in the previous section.
4. For **Identity Type** select **Named Principal**. For the **Authentication Protocol**, select **AWS Signature Version 4**. Fill in the **Access key ID** you recorded in the previous section as "AWS

Access Key ID", the **Secret access key** as the "AWS Secret Access Key", the AWS Region, and "lambda" as the "AWS Service."

The screenshot shows the Salesforce Setup interface. The top navigation bar includes 'Setup', 'Home', and 'Object Manager'. A search bar at the top right says 'Search Setup'. On the left, a sidebar has 'Security' expanded, with 'Named Credentials' selected. A message says 'Didn't find what you're looking for? Try using Global Search.' The main content area is titled 'SETUP Named Credentials'. It shows a table with one row highlighted in red. The row contains 'Edit | Del' and the name 'AwsGenerateAudioRecordingURL'. To the right of the name is the URL: 'https://lambda.{awsRegion}.amazonaws.com/2015-03-31/functions/{lambdaFunctionName}/invocations/'. A 'New Named Credential' button is at the top right of the table.

5. Select **save**.

6. In the setup search box, search for "Permission sets". Select the "AC_CallRecording" permission set. Select "Manage Assignments".

The screenshot shows the Salesforce Setup interface. The top navigation bar includes 'Setup', 'Home', and 'Object Manager'. A search bar at the top left says 'Perm'. On the left, a sidebar has 'Users' expanded, with 'Permission Set Groups' selected. A message says ' Didn't find what you're looking for? Try using Global Search.' The main content area is titled 'SETUP Permission Sets'. It shows a table with one row highlighted in red. The row contains 'Find Settings...', 'Clone', 'Delete', 'Edit Properties', and a 'Manage Assignments' button. Below the table is a section titled 'Permission Set Overview' with fields for 'Description', 'License', 'Session Activation Required' (unchecked), and 'Last Modified By' (Bomi Lee, 10/12/2020, 5:07 PM). At the bottom, there is a section titled 'Apps' with 'Assigned Apps' and 'Assigned Connected Apps'.

7. Select "Add Assignments". Add the users that should have access to the audio recordings and select "assign!".

Enabling call recording streaming

1. Login to your Amazon Connect instance as an Administrator
2. From the left navigation, choose **Routing** then select **Contact flows**

3. Open the contact flow that you want to use to enable call recording import. This contact flow must have Amazon Connect's native recording turned on.
4. In your contact flow, before you transfer to queue, add a new **Set contact attributes** block
5. Configure the block to set a contact attribute as follows:
 - a. **Destination key:** postcallRecordingImportEnabled
 - b. **Value:** true

Attribute to save

6. Save the Set contact attributes block. Make sure it is appropriately connected to your contact flow, and **Publish** the flow.
7. Wait approximately 2 minutes to give the contact flow time to publish.
8. Place a call, connect to your agent, speak for a few moments to test the audio, then end the call.
Make sure the agent exits after call work
9. After a minute or so, the recording should import.

Adding Contact Channel Analytics to the Service Console

1. Log in into your Salesforce org and go to the **Service Console**
2. Expand the **navigation menu** by selecting the down arrow and choose **Edit**.

3. On the Edit Service Console App Navigation Items page, select **Add More Items**

Edit Service Console App Navigation Items

  }  
]
```

[Copy](#)

5. Verify that your named credentials are correctly set up

6. Verify that your user is added to the AC_CallRecording permission set

Recording Transcripts

Enabling the Recording Transcripts activates a process to run your contact recordings through Amazon Transcribe which uses a deep learning process to convert text to speech accurately and quickly. In addition, this process also creates a visual waveform of the recording, enables the in-app recording playback, and provides a visual representation of the conversation.

Once enabled during the AWS Serverless Application Repository for Salesforce, recording transcription is activated on a call by call basis by adding a specific contact attribute. This attribute is used during

Contact Trace Record processing to trigger the transcription.

Make sure the Salesforce user accessing recording transcription are added to the AC_CallRecording permission set, as described in the previous section.

Enabling recording transcription

1. Login to your Amazon Connect instance as an Administrator
2. From the left navigation, choose **Routing** then select **Contact flows**

3. Open the contact flow that you want to use to enable call transcription. This contact flow must have Amazon Connect's native recording turned on, since the transcription is dependent on it.
4. In your contact flow, before you transfer to queue, add a new **Set contact attributes** block
5. Configure the block to set two contact attributes as follows:
 - i. Attribute 1: enables the transcription process
 - a. **Destination key:** postcallTranscribeEnabled
 - b. **Value:** true
 - ii. Attribute 2: specifies the transcription language
 - a. **Destination key:** postcallTranscribeLanguage
 - b. **Value:** en-US (See [Amazon Transcribe API Reference](#) for valid language codes)

The screenshot shows two configurations for setting contact attributes. The first configuration uses a destination key ('postcallTranscribeEnabled') with a value of 'true'. The second configuration uses a destination key ('postcallTranscribeLanguage') with a value of 'en-US'. Both configurations are set to use text.

Destination key
postcallTranscribeEnabled

Value
true

Destination key
postcallTranscribeLanguage

Value
en-US

6. **Save** the Set contact attributes block. Make sure it is appropriately connected to your contact flow, and **Publish** the flow.
7. Wait approximately 2 minutes to give the contact flow time to publish.
8. Place a call, connect to your agent, speak for a few moments from both the agent and the customer side to generate a good transcript, then end the call. Make sure the agent exits after call work
9. The transcription will take at least as long as the call did. Wait an appropriate amount of time for the transcription to be available.

Accessing transcriptions

1. Log in into your Salesforce org and go to the **Service Console**
2. Expand the **navigation menu** by selecting the down arrow and choose AC Contact Channel Analytics. If you have not previously added AC Contact Channel Analytics to the navigation menu, complete the steps found in [Adding Contact Channel Analytics to the Service Console](#).

AI Driven Contact Analysis

Enabling the AI Driven Contact Analysis function allows you to process the transcribed text using [Amazon Comprehend](#). Amazon Comprehend is a natural language processing service that uses machine learning to find insights and relationships in text.

Once enabled during the AWS Serverless Application Repository for Salesforce, contact analysis is activated on a call by call basis by adding a specific contact attribute. This attribute is used during Contact Trace Record processing to trigger the Amazon Comprehend task.

There are five functions available with the integration. Each function is triggered by a code. You can use one code in your contact attribute, or string multiple together as a comma separated list. The available codes and their functions are:

- **snt = Sentiment Analysis**

- **kw = Keyphrase Extraction**
- **dl = Language Detection**
- **ne = Custom Entities**
- **syn = Syntax Analysis**

Enabling AI Driven Contact Analysis

1. Login to your Amazon Connect instance as an Administrator
2. From the left navigation, choose **Routing** then select **Contact flows**

3. Open the contact flow that you want to use to enable AI Driven Contact Analytics. This contact flow must have Amazon Connect's native recording turned on, and transcription enabled as these are both prerequisites for the analytics function.
4. In your contact flow, before you transfer to queue, add a new **Set contact attributes** block
5. Configure the block to set a contact attribute as follows:
 - a. **Destination key:** postcallTranscribeComprehendAnalysis
 - b. **Value:** snt,dl,kw,syn

– In this example, we are performing sentiment analysis, language detection, and keyphrase extraction

Attribute to save

6. Save the Set contact attributes block. Make sure it is appropriately connected to your contact flow, and **Publish** the flow.
7. Wait approximately 2 minutes to give the contact flow time to publish.
8. Place a call, connect to your agent, speak for a few moments from both the agent and the customer side to generate a good transcript, then end the call. Make sure the agent exits after call work
9. The contact analysis runs after the transcription, which will take at least as long as the call did. Wait an appropriate amount of time for the analysis to be available.

Accessing the AI Driven Contact Analysis

1. Log in into your Salesforce org and go to the **Service Console**
2. Expand the **navigation menu** by selecting the down arrow and choose AC Contact Channel Analytics. If you have not previously added AC Contact Channel Analytics to the navigation menu, complete the steps found in [Adding Contact Channel Analytics to the Service Console](#).

Contact Trace Record Import

In Amazon Connect, data about contacts is captured in contact trace records (CTR). This data can include the amount of time a contact spends in each state: customer on hold, customer in queue, agent interaction time. The basis for most historical and real-time metrics in Amazon Connect is the data in the CTR. When you create metrics reports, the values displayed for **most** (not all) metrics in the report are calculated using the data in the CTRs.

CTRs are available within your Amazon Connect instance for 24 months from the time when the associated contact was initiated. You can also stream CTRs to Amazon Kinesis to retain the data longer, and perform advanced analysis on it. Additionally, with the AWS Serverless Application Repository for Salesforce, you can import Contact Trace Records into your Salesforce org.

Contact Trace Record Import

Once enabled during the AWS Serverless Application Repository for Salesforce, CTR import is activated on a call by call basis by adding a specific contact attribute. This attribute is used during Contact Trace Record processing to trigger the import task.

Enabling Contact Trace Record Import

1. Login to your Amazon Connect instance as an Administrator
2. From the left navigation, choose **Routing** then select **Contact flows**

3. Open the contact flow that you want to use to enable call recording import.
4. In your contact flow, before you transfer to queue, add a new **Set contact attributes** block
5. Configure the block to set a contact attribute as follows:
 - a. **Destination key:** postcallCTRImportEnabled
 - b. **Value:** true

Attribute to save

The dialog shows the configuration for a 'Set contact attributes' block. The 'Use text' tab is selected. The 'Destination key' field contains 'postcallCTRImportEnabled'. The 'Value' field contains 'true'.

| | |
|---|----------------------------------|
| <input checked="" type="radio"/> Use text | <input type="button" value="X"/> |
| Destination key | postcallCTRImportEnabled |
| Value | true |
| <input type="radio"/> Use attribute | |

6. **Save** the Set contact attributes block. Make sure it is appropriately connected to your contact flow, and **Publish** the flow.
7. Wait approximately 2 minutes to give the contact flow time to publish.

8. Place a call, connect to your agent, speak for a few moments, then end the call. Make sure the agent exits after call work
9. The Contact Trace Record is emitted shortly after call completion and the import happens almost immediately.

Adding Contact Trace Records to the Service Console

1. Log in into your Salesforce org and go to the **Service Console**
2. Expand the **navigation menu** by selecting the down arrow and choose **Edit**.

3. On the Edit Service Console App Navigation Items page, select **Add More Items**

| 5 | <input type="checkbox"/> CTR 0000000004 |

10. Select a record to view it

11. Note the ContactId value from Amazon Connect

Display Additional Contact Trace Record Data

By default, the AC Contact Trace Record layout only contains the ContactId. However, all of the CTR data has been imported. It is likely that you will want to customize this view to show more data.

Customizing the AC Contact Trace Record Layout

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** field, enter object and choose **Object Manager** from the results

3. In the Object Manager, find the **AC Contact Trace Record** object and select it

4. In the left navigation, choose **Page Layouts**

5. Select **AC Contract Trace Record Layout**

6. Select items from the Fields section and add them to the layout as you wish. In the example below, I have selected Agent Username, Queue Name, Queue Duration, After Contact Work Duration, Agent Interaction Duration, and Attributes

The screenshot shows the 'AC Contact Trace Record Detail' page. At the top, there is a header with 'AC Contact Trace Record Detail' and a 'Standard Buttons' section containing 'Edit', 'Delete', 'Clone', 'Change Owner', 'Change Record Type', 'Printable View', and 'Sharing' buttons. To the right of these buttons is a 'Custom Buttons' section. Below the header, there is a section titled 'Information (Header visible on edit only)'. This section contains a table with fields: 'Contact Trace Record' (value: GEN-2004-001234), 'Channel' (value: Sample Text), 'ContactId' (value: Sample Text), 'After Contact Work Duration' (value: 76,916), 'Agent Interaction Duration' (value: 37,408), 'Owner' (value: Sample Text), 'Agent Username' (value: Sample Text), 'Queue Name' (value: Sample Text), 'Queue Duration' (value: 18,140), and 'Attributes' (value: Sample Text).

7. Save the layout

8. Return to the **Service Console**

9. Refresh the browser

10. Expand the **navigation menu** by selecting the down arrow and choose **AC Contact Trace Records**

11. Select a contact trace record

12. You should now see your modified layout

AC Contact Trace Record

Postcall Contact Lens Import

Contact Lens for Amazon Connect is a set of machine learning (ML) capabilities integrated into Amazon Connect. With Contact Lens for Amazon Connect, contact center supervisors can better understand the sentiment, trends, and compliance of customer conversations to effectively train agents, replicate successful interactions, and identify crucial company and product feedback.

Contact Lens are available within your Amazon Connect instance in CTR page, and Contact Lens data are stored in Amazon Connect S3 bucket. With the AWS Serverless Application for Salesforce (Amazon Connect Salesforce Lambda), you can import Contact Lens data into your Salesforce org.

Contact Lens Import

Before using AWS Serverless Application (Amazon Connect Salesforce Lambda) to import Contact Lens data, you need to enable Contact Lens in Amazon Connect. More information can be found at <https://docs.aws.amazon.com/connect/latest/adminguide/enable-analytics.html>.

Once enabled during the installation of AWS Serverless Application (Amazon Connect Salesforce Lambda), Contact Lens import is activated on a call by call basis by adding a specific contact attribute. This attribute is used during Contact Lens processing to trigger the import task.

Creating the AWS Lambda Trigger for the Contact Lens Data

1. Make sure you set **ContactLensImportEnabled** to **true** during the deployment of Amazon Connect Salesforce Lambda application.
2. Once the deployment is finished, you need to configure a trigger that invokes a Lambda function when Contact Lens output file is generated and stored in S3.
3. In a browser tab, login to the [AWS Console](#).
4. Open the [AWS Lambda Console](#).
5. In the filter field of the AWS Lambda console, enter sfProcessContactLens and press enter to filter the list of functions.
6. Select the Lambda that includes sfProcessContactLens in the name.
7. Expand the Designer section.
8. Select Add trigger

▼ Designer

[Go back to application serverlessrepo-AmazonConnectSalesforceLambda](#)

9. In Trigger configuration, select S3 from the dropdown list

Lambda > Add trigger

Add trigger

Trigger configuration

Select a trigger

DynamoDB
aws database nosql

Kinesis
analytics aws streaming

S3
aws storage

SNS
aws messaging notifications pub-sub push

S3

SQS
aws queue

10. Select the bucket of your Amazon Connect instance. You can find your Amazon Connect bucket name by clicking on your Amazon Connect instance alias in Amazon Connect console.

11. Change the Event type to PUT.

12. Set the Prefix to **Analysis/Voice/2020**. Note that this might change as the date changes so you will need to update this on the first day of every new year.

13. Set the Suffix to **.json**

14. The trigger configuration should now be similar to the following:

Add trigger

Trigger configuration

S3

aws storage

Bucket

Please select the S3 bucket that serves as the event source. The bucket must be in the same region as the function.

connect-[REDACTED]

Event type

Select the events that you want to have trigger the Lambda function. You can optionally set up a prefix or suffix for an event. However, for each bucket, individual events cannot have multiple configurations with overlapping prefixes or suffixes that could match the same object key.

PUT

Prefix - optional

Enter a single optional prefix to limit the notifications to objects with keys that start with matching characters.

Analysis/Voice/2020

Suffix - optional

Enter a single optional suffix to limit the notifications to objects with keys that end with matching characters.

.json

Lambda will add the necessary permissions for Amazon S3 to invoke your Lambda function from this trigger. [Learn more](#) about the Lambda permissions model.

The Lambda console no longer supports disabling S3 and CloudWatch Logs triggers. Delete these triggers to stop further actions.

Recursive invocation

If your function writes objects to an S3 bucket, ensure that you are using different S3 buckets for input and output. Writing to the same bucket increases the risk of creating a recursive invocation, which can result in increased Lambda usage and increased costs. [Learn more](#)

I acknowledge that using the same S3 bucket for both input and output is not recommended and that this configuration can cause recursive invocations, increased Lambda usage, and increased costs.

Cancel

Add

15. Select **Add**

16. If everything has been configured correctly, you should receive a success message.

Enabling Contact Lens Import

1. Login to your Amazon Connect instance as an Administrator

2. From the left navigation, choose **Routing** then select **Contact flows**

3. Open the contact flow that you want to use to enable Contact Lens import.

4. In your contact flow, before you transfer to queue, add a new **Set contact attributes** block

5. Configure the block to set a few contact attributes:

- To turn on Contact Lens data import, set **contactLensImportEnabled** to **true**.

- For recording import, there are two options: original call recording and redacted call recording.
Note that you can only import one of the recordings for each contact.

- To turn on original recording import, set ***postcallRecordingImportEnabled*** to **true**

- To turn on redacted recording import, set ***postcallRedactedRecordingImportEnabled*** to **true**

- Save the Set contact attributes block. Make sure it is appropriately connected to your contact flow, and **Publish** the flow.
- Wait approximately 2 minutes to give the contact flow time to publish.
- Place a call, connect to your agent, speak for a few moments, then end the call. Make sure the agent exits after call work
- The Contact Lens data is emitted a couple of minutes after call completion and the import happens almost immediately.

Configuring My Domain in Salesforce

The latest CTI adapter includes several lightning components that provide a better administrative user experience. Salesforce requires that My Domain be enabled to make use of lightning components. Setting up My Domain is a fairly simple setup, but it does require some time for the changes to propagate, so it will be helpful to complete this configuration in advance of your CTI adapter deployment.

Register Your Domain

Step 1 in the process is registering your domain in Salesforce. This allows you to check availability of the domain and complete the registration process. It will take some amount of time for the registration to complete.

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** field, enter **My Domain**, then select **My Domain** from the result list

3. In the **My Domain Step 1** section, enter your desired domain name and select **Check Availability** to determine if the domain is available.

Choose Your Domain Name

Enter a domain name and check whether it's available. Be sure of your name before registering. Only Salesforce Customer Support can change your domain name once it's registered.

Your domain name can be up to 34 characters. It can include letters, numbers, and hyphens; but it can't start or end with a hyphen.

4. If the domain is not available, you will need to try a different name.
5. If the domain is available, select **Register Domain

[Check Availability](#)  Available

Register Domain After you click Register Domain, Salesforce takes a few minutes to update its naming registries. You receive an email when it's done.

6. The domain registration process will begin. You will receive an email once it is complete. Once you receive the confirmation, you may continue with the next section.

My Domain

[Help for this Page](#) 

My Domain Step 2

Showcase your company's brand and keep your data more secure by adding a custom domain name to your Salesforce URL. Because having a custom domain is more secure, some Salesforce features require it. It's easy to set up My Domain—the hardest part is choosing a name that your stakeholders can agree on.

Your domain name is **sfseorgb-dev-ed.my.salesforce.com**

 Registering your domain. You'll receive an email when it's ready for testing.

Deploy the Domain to Your Users

Once the domain registration process completes, you then need to deploy the domain to your users.

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** field, enter **My Domain**, then select **My Domain** from the result list

The screenshot shows the Salesforce Setup interface. The top navigation bar has tabs for **Setup**, **Home**, and **Objects**. A search bar at the top contains the text "My domain". Below the search bar, there is a list of categories under "Company Settings": "My Domain" (which is highlighted with a red box), "Email", "File", "Help", "Integrations", "Mobile", "Reporting", "Setup", and "User Management".

Didn't find what you're looking for?
Try using Global Search.

3. In the **My Domain Step 2** section, note the domain name, then select the **Log in** button to login using the new domain.

Your domain name is **sfseorgb-dev-ed.my.salesforce.com**

Your domain name is ready. Log in to test it out. **Log in**

To test your new domain, click tabs and links. If you've customized the UI, check for hard links to your original URL.

4. Once the login completes, you should see your new domain in the address bar of your browser. You should also be returned to the My Domain configuration.

5. Select the Deploy to Users button to deploy your domain

Your domain name is **sfseorgb-dev-ed.my.salesforce.com**

Your domain name is ready. Log in to test it out. **Log in**

To test your new domain, click tabs and links. If you've customized the UI, check for hard links to your original URL.

Deploy to Users Roll out the new domain to your org. 

6. You should get a popup message that warns you about the domain deployment. Select OK.

...edded page at sfseorgb-dev-ed.my.salesforce.com says

When you deploy the new domain, we activate it immediately. Only Salesforce Customer Support can disable or change your domain name once it's deployed.

Cancel

OK

7. Deployment should now be complete

Configure Salesforce Omnichannel for Testing

In order to sync your Connect User status with your Omni-Channel agent status, you must configure Omni-Channel Presence Syncing. This will make your Omni-Channel presence status match your Amazon Connect Agent Status and vice versa.

Enable Omnichannel

First, we must enable omni-channel. Once you enable Omni-Channel, you will have access to the other components in Salesforce that will be required for Omni-Channel setup.

Enable Omnichannel in Your Salesforce Org

1. Log in into your Salesforce org and go to **Setup**

2. In the **Quick Find** field, enter omni and choose **Omni-Channel Settings** from the results

3. Select the checkbox for Enable Omni-Channel and choose Save

Omni-Channel Settings

Omni-Channel routes work items to your support agents. It sets agent capacity for accepting work and agent availability.

A screenshot of the 'Omni-Channel Settings' page. It contains several configuration options with checkboxes:

- Enable Omni-Channel (checkbox is checked)
- Enable Skills-Based Routing (checkbox is unchecked)
- Enable Secondary Routing Priority (checkbox is unchecked)
- Display a login confirmation upon loading a console with Omni-Channel (checkbox is unchecked)

At the bottom right, there are 'Save' and 'Cancel' buttons.

4. Omni-Channel is now enabled.

Configure Presence Statuses

Once you have enabled Omni-Channel, you will need to configure presence statuses to reflect the different presence states that you wish your Omni-Channel agents to enter. These do not need to match agent statuses in Amazon Connect exactly, but it does make it easier to track what you are doing.

Add a Presence Status

1. Log in into your Salesforce org and go to **Setup**

2. In the **Quick Find** field, enter presence and choose **Presence Statuses** from the results

The screenshot shows a navigation interface with a search bar at the top containing the text "presence". Below the search bar is a tree-like navigation menu. The "Feature Settings" node is expanded, showing "Service" and "Omni-Channel" as children. "Omni-Channel" is also expanded, showing three options: "Presence Configurations", "Presence Decline Reasons", and "Presence Statuses", which is highlighted with a red rectangular border.

3. In the Presence Statuses page, choose New

4. Provide a status name, for example Lunch

5. Set the Status options appropriately, for example, Busy

6. For Online statuses, you will need to provide a channel. Please reference the [Omni-Channel documentation](#) for details

7. Choose Save

Presence Statuses

Let agents indicate when they're online and available to receive work items from a specific service channel, or whether they're away or offline.

The screenshot shows a form titled "Presence Statuses" with a "Basic Information" section and a "Status Options" section. In the "Basic Information" section, there are two input fields: "Status Name" containing "Lunch" and "Developer Name" containing "Lunch". In the "Status Options" section, there is a dropdown menu with two options: "Online" and "Busy", where "Busy" is selected. At the bottom of the form are "Save" and "Cancel" buttons.

8. Repeat as necessary for all desired statuses

Configure Profiles to Use the New Statuses

Before agents can use the statuses that have been configured, you will need to make sure that they have been provided rights to them. This is done by modifying the profiles assigned to your agents.

Modify Profiles to Use New Statuses

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** field, enter profiles and choose **Profiles** from the results

3. Select the profile assigned to your users
4. Hover over the Enabled Service Presence Status link and choose Edit

5. Select the available status from the left, then choose the Add button to add it to the Enabled Service Presence Statuses field

Enable Service Presence Status Access

6. Select Save

7. Repeat as necessary for other statuses or profiles.

Add Omni-Channel to the Utility Bar

To provide agents access to the Omni-Channel tool, you will need to add it to the Service Console.

Add the Omni-Channel Utility Item

1. Log in into your Salesforce org and go to **Setup**

2. In the **Quick Find** box, type **App Manager**, then choose **App Manager** from the result list.

The screenshot shows the Salesforce App Manager interface. At the top, there are tabs for 'Setup', 'Home', and 'Object'. Below that is a search bar containing 'App Manager'. Underneath the search bar, there's a section titled 'Apps' with a dropdown arrow. A red box highlights the 'App Manager' item in the list of results.

Didn't find what you're looking for?

Try using Global Search.

3. Expand the drop-down menu associated to Service Console and select **Edit**.

Navigation Rules

5. Choose Add Utility Item, then select Omni-Channel

6. Adjust the order of the utility items as desired and select Save.

7. Return to the Service Console and refresh your browser.

8. You should now see the Omni-Channel utility item.

Appendix B: Configuring Salesforce as Your Identity Provider

Prerequisites

To complete the SSO integration between Salesforce and Amazon Connect, you need:

1. An Amazon Connect Instance configured for SAML authentication
2. Appropriate AWS permissions to create Identity and Access Management (IAM) roles and policies
3. Administrator permissions for your Salesforce Org
4. Amazon Connect CTI Adapter AppExchange package installed and configured

Configuring Salesforce as an Identity Provider

First, we need to enable Salesforce to act as an identity provider (IdP). An IdP performs end user authentication and provides the credentials to the requesting service provider. In this case, Salesforce server as the IdP and Amazon Connect the service provider, while being embedded in Salesforce.

Setup Identity Provider & Download Metadata

1. Log in into your Salesforce org and go to **Setup**.
2. In the **Quick Find** field, type **Identity Provider**, then select **Identity Provider** from the result list
3. Identity Provider may be enabled by default. If not, choose **Enable Identity Provider**, then select the appropriate certificate and select **Save**.

Identity Provider

Enable Salesforce.com as an identity provider so you can use single sign-on with other web sites, and define the appropriate service providers whose applications support single sign-on. You can switch to different service providers without having to log in again. [Learn more...](#)

The screenshot shows the 'Identity Provider Setup' page. At the top, there is a button labeled 'Enable Identity Provider' which is highlighted with a red box. Below this, a message says 'Click Enable Identity Provider to enable your Salesforce.com organization as an identity provider.' Under the heading 'Service Providers', it says 'Service Providers are now created via Connected Apps. Click here.' There is a table with columns 'Name' and 'Created Date', showing 'No Service Providers'.

4. Choose **Download Metadata** and save the file to your computer.

Identity Provider

[Help for this Page](#) 

Enable Salesforce.com as an identity provider so you can use single sign-on with other web sites, and define the appropriate service providers whose applications support single sign-on. You can switch to different service providers without having to log in again. [Learn more...](#)

Quick Tips

- [Certificates and Keys](#)
- [About Single Sign-On](#)
- [My Domain](#)

The screenshot shows the 'Identity Provider Setup' page. At the top, there is a button labeled 'Download Metadata' which is highlighted with a red box. Below this, there are sections for 'Details' (Issuer: https://ctiadapterdemo-dev-ed.my.salesforce.com), 'Currently chosen certificate details' (Label: SelfSignedCert_17Feb2020_221125, Created Date: 2/17/2020, 2:11 PM, Unique Name: SelfSignedCert_17Feb2020_221125, Expiration Date: 2/17/2021, 4:00 AM, Key Size: 2048), and 'SAML Metadata Discovery Endpoints' (Salesforce Identity: https://ctiadapterdemo-dev-ed.my.salesforce.com/.well-known/samlidp.xml).

Configure the Identity Provider, Policy, and Role in the AWS Console

Next, you need to configure the identity provider (Salesforce) in the AWS console and provide access to Amazon Connect via IAM policies and roles. This allows AWS to acknowledge Salesforce as the identity provider and to provide users authenticated through Salesforce with the access required to login to Amazon Connect.

Configure the Identity Provider

1. Login to the [AWS console](#)
2. Open the [AWS identity and Access Management \(IAM\) Console](#)
3. Select **Identity providers**

Identity and Access Management (IAM)

Dashboard

▼ Access management

Groups

Condition [+ Add condition \(optional\)](#)

7. Select **Next: Permissions**

8. On the Attach permissions policies page, select **Create policy**. This will open a new browser tab.

9. Choose the **JSON** tab to switch to the JSON editor

10. Replace the existing JSON with the following:

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Sid": "Statement1",  
      "Effect": "Allow",  
      "Action": "sts:AssumeRole",  
      "Resource": "arn:aws:iam::123456789012:role/SalesforceConnect"  
    }  
  ]}
```

```

        "Effect": "Allow",
        "Action": "connect:GetFederationToken",
        "Resource": [
            "**YOUR ARN**/user/${aws:userid}"
        ]
    }
]
}

```

11. Replace **YOUR ARN** with the ARN of your Amazon Connect instance. To find your Amazon Connect instance ARN:

12. Open a new tab in your browser and navigate to [Amazon Connect Console](#)

13. Click on the name (alias) of your Amazon Connect instance

14. Copy the Instance ARN and paste it to your computer's notepad (you will use it in a few places)

15. Choose **Review policy**

16. Set the Name to **SalesforceConnectPolicy**

17. Select **Create Policy**

18. Once the Policy has been created, close the tab, go back to the original (Role) tab in your browser and select the **Refresh** button (do not refresh the browser)

19. In the search field, enter **SalesforceConnectPolicy** and select the box to attach the policy.

Create role

1 2 3 4

Attach permissions policies

Choose one or more policies to attach to your new role.

| <input type="button" value="Create policy"/> | <input type="button" value=""/> | <input type="button" value=""/> |
|---|---------------------------------|---------------------------------|
| <input type="button" value="Filter policies"/> <input type="text" value="SalesforceConnectPolicy"/> | | Showing 1 result |
| | Policy name | Used as |
| <input checked="" type="checkbox"/> | SalesforceConnectPolicy | None |

20. Choose **Next: Tags** and set tags if desired, then choose **Next: Review**

21. Name the Role **SalesforceConnectRole** and provide a description if you like

22. Select Create role

Complete the Base Salesforce Configuration

Next, you need to configure a Connect App in Salesforce and provide further configuration to complete the SAML integration.

Create the Connected App in Salesforce

1. Log in into your Salesforce org and go to **Setup**
2. In the **Quick Find** field, type **App Manager**, then select **App Manager** from the result list
3. Select New Connected App

4. Provide a name for the Connected App, such as **AmazonConnectSAML**, then press tab and the API Name should auto-populate
5. Provide an email contact address

New Connected App

Save Cancel

Basic Information

| | |
|--------------------|--|
| Connected App Name | <input type="text" value="AmazonConnectSAML"/> |
| API Name | <input type="text" value="AmazonConnectSAML"/> |

| <input type="button" value="Save"/> <input type="button" value="Cancel"/> | |

16. Select New again to configure another custom attribute

17. Set Key as <https://aws.amazon.com/SAML/Attributes/Role>

18. The Value is going to be a combination of the Identity Provider and IAM Role ARNs.

- a. In a new tab, open the [AWS identity and Access Management \(IAM\) Console](#)
- b. On the left navigation, select **Identity providers**
- c. Select the Identity provider you created earlier, which should be named **SalesforceConnect**
- d. Copy the **Provider ARN** to your computer's notepad
- e. Return to the IAM console and select **Roles**
- f. Select the Role you created earlier, which should be **SalesforceConnectRole**
- g. Copy the **Role ARN** to your computer's notepad
- h. Format the combined value as follows: 'Identity Provider ARN' & ',' & 'Role ARN'
- i. Paste the formatted value into the Custom Attribute Value

19. Select **Save**

Create Custom Attribute

The screenshot shows a 'Create Custom Attribute' dialog box. The 'Key' field is set to 'https://aws.amazon.com'. The 'Value' field contains the following text:
'arn:aws:iam::YOURACCOUNT:saml-provider/SalesforceConnect' & ',' &
'arn:aws:iam::YOURACCOUNT:role/SalesforceConnectRole'
Below the dialog are 'Save' and 'Cancel' buttons.

20. At the top of the Connected App description, select **Manage**
21. Scroll down to the **SAML login Information** section
22. Copy the **IdP-Initiated Login URL** to your computer's notepad
23. Scroll down to find the Profiles section, then select **Manage Profiles**
24. Select a profile from the list, for example System Administrator for testing purposes
25. Choose **Save**

26. Open a new tab in your browser and navigate to IdP-Initiated Login URL that you copied in an earlier step

27. The browser will redirect to AWS Console and log you in automatically as a federated user **Note:** you may be able to see AWS services, but you should have no configuration rights.

The screenshot shows the AWS Management Console interface. At the top, there's a navigation bar with the AWS logo, a 'Services' dropdown, a 'Resource Groups' dropdown, and a user dropdown showing 'SalesforceConnectRole/douglas...'. Below the header, the main title 'AWS Management Console' is displayed in a large, bold font.

28. The Federated Login consists of the Role name and your Salesforce email address.

29. Initial validation is complete

Complete the Amazon Connect Configuration

The last step in the SAML setup is to add users to Amazon Connect that exist in your Salesforce org, then validate login. It is critical that the usernames for both platforms match exactly.

Add Users to Amazon Connect

1. In a new browser tab, login to the [AWS console](#)
2. Open the [Amazon Connect Console](#)
3. Select the name (alias) of your Amazon Connect instance
4. Choose **Login as administrator**

Overview

| | |
|---------------------|--|
| Instance ARN | arn:aws:connect:us-west-2: XXXXXXXXXX instance: XXXXXXXXXX |
| Directory | ctiadapterdemo |
| Service-linked role | ! AWSServiceRoleForAmazonConnect_ Learn more |
| Login URL | https://ctiadapterdemo.awsapps.com/connect/login |

5. Within the Amazon Connect administration portal, select **Users** then choose **User Management**
6. Leave **Create and setup a new user** selected and choose **Next**
7. Complete the First and Last name fields as appropriate

8. Set the login name to match the **Email Address** of your Salesforce user

9. Set the **Routing Profile**. In this example, the default Basic Routing Profile is shown

10. Set the **Security Profile**. In this example, *Admin* is shown

Add new user

The screenshot shows the 'Add new user' page in the Salesforce interface. The top navigation bar indicates three steps: 'Select source' (step 1), 'Add user details' (step 2, highlighted in blue), and 'Verify user details' (step 3). The 'Add user details' section contains fields for First name (Jason), Last name (Douglas), and Login name (jctliadapterdemo@amazon.com). Below this, there are three columns: 'Routing Profile' (Basic Routing Profile), 'Security Profiles' (Admin), and 'Phone Type' (Soft phone, Auto-Accept Call checkbox).

11. Select **Save**

12. Select **Create Users**

13. Repeat this process as required for your staff

Final Configuration for the Lightning Experience

Now that all of the underlying pieces are in place, the last steps are to create the Amazon Connect Single Sign On URL and validate that it works correctly, then configure the Lightning CTI adapter and login the agent.

Create the Amazon Connect SSO URL

You create the Amazon Connect SSO URL by combining the IdP-Initiated Login URL that you copied earlier, and a relay state URL that will redirect the authenticated user to your Amazon Connect instance.

The 'RelayState' will be in the following format:

`https://console.aws.amazon.com/connect/federate/InstanceId?destination=%2Fconnect%2Fccp`

Please note that "console.aws.amazon.com" refers to US-East-1 region (N. Virginia). If your Amazon Connect instance is in a different region, please use the region Console URL. For example:

<https://us-west-2.console.aws.amazon.com/connect/federate/InstanceId?destination=%2Fconnect%2Fccp>

1. To begin, format the relay state URL by replacing **InstanceId** with your Instance Id. To find your Amazon Connect Instance Id:
 - a. Open a new tab in your browser and navigate to the [Amazon Connect Console](#)
 - b. Click on the name (alias) of your Amazon Connect
 - c. From the Instance ARN, copy the portion after the '/'. This is the Instance Id

Overview

The screenshot shows the 'Overview' section of the Amazon Connect console. It includes fields for 'Instance ARN' (arn:aws:connect:us-east-1:...:instance/f0c669ee-21dc-...), 'Directory' (redacted), 'Login URL' (<https://...awsapps.com/connect/login>), and a 'Login as administrator' button. A red arrow points to the 'InstanceId' part of the Instance ARN value.

2. Concatenate the 'IdP-Initiated Login URL' and the 'RelayState', by combining the two with "&RelayState=" in between, for example:

https://mXXXXXXrun-dev-ed.my.salesforce.com/idp/login?
app=0sp0N000000Caid&RelayState=https://console.aws.amazon.com/connect/federate/InstanceId?
destination=%2Fconnect%2Fccp

3. This is the Final SSO URL, needed for the Amazon Connect Lightning CTI Adapter Configuration.
4. To validate this URL:
 - a. Open a new tab in the same browser that you are logged into Salesforce
 - b. Paste the fully concatenated URL into the new browser and press enter
 - c. You should automatically login and be redirected to the Amazon Connect Contact Control Panel.
5. Once you validate the full URL, you are ready to add it to the Lightning Adapter

Configure the CTI Lightning Adapter in Salesforce For SSO

Now we are ready to complete the last step in the configuration process: Adding the SSO settings for Salesforce to the Lightning Adapter. This will configure the adapter to authenticate via SSO and redirect to the Amazon Connect Contact Control Panel once authentication completes.

1. Log in into your Salesforce org and go to the **Service Console**

2. Expand the **navigation menu** by selecting the down arrow and choose **AC CTI Adapters**.

3. Select **ACLightningAdapter**

4. Scroll down to the Single SignOn (SSO) section and choose the pencil icon of either field to edit

▼ Single SignOn (SSO)

SSO Url

SSO Relay State

5. For the SSO Url, copy the first part of the SSO URL that you created previously, up to the first question mark (do not copy the question mark), for example:

```
https://mXXXXXrun-dev-ed.my.salesforce.com/idp/login?  
app=0sp0N00000Caid&RelayState=https://console.aws.amazon.com/connect/feder  
ate/<b>InstanceId</b>?destination=%2Fconnect%2Fccp
```

6. Paste this portion of the URL into the **SSO Url** field

▼ Single SignOn (SSO)

SSO Url

https://sample-dev-ed.my.salesforce.com/idp/login

7. For the SSO Relay State, copy everything AFTER the question mark (do not copy the question mark), for example:

```
https://mXXXXXrun-dev-ed.my.salesforce.com/idp/login?  
app=0sp0N00000Caid&RelayState=https://console.aws.amazon.com/connect/feder  
ate/<b>InstanceId</b>?destination=%2Fconnect%2Fccp
```

8. Paste this portion of the URL into the **SSO Relay State** field

▼ Single SignOn (SSO)

| | |
|-----------------|---|
| SSO Url | <input type="text" value="https://sample-dev-ed.my.salesforce.com/idp/login"/> |
| SSO Relay State | <input type="text" value="app=0sp6g000000XZyd&RelayState=https://us-west-2.console.aws.amazon.com/connect/federate/YOUR-INSTANCE-ID?destination=%2Fconnect%2Fccp"/> |

9. Choose **Save**

10. **Refresh** your browser to make the changes take effect

- a. **NOTE:** If you receive a blocked popup warning, select the warning and change the setting to always allow popups from your Salesforce org, then refresh the browser again

11. After a few seconds, a new window should pop up for a moment. This window is performing the authentication and setting your session cookie. Once it does this, it will close automatically.

Change status ▾

Initializing...

12. Once the authentication window closes, select the **phone icon** in the console toolbar to open the CCP Note: You may also receive popups to allow notifications and microphone access. Please accept both.
13. You should now see the authenticated and logged in CCP

14. Configuration is complete

Appendix C: CTI Flow Sources and Events

The following sources are defined in the adapter for use with CTI Flows:

- Initialization
 - onInit -- The CTI adapter has initialized.
- Amazon Connect Agent
 - onRefresh -- The Connect agent's data was updated.
 - onStateChange -- The Connect agent's state changed.
 - onRoutable -- The Connect agent became available for contacts.
 - onNotRoutable -- The Connect agent became unavailable for contacts.
 - onOffline -- The Connect agent's state was set to "Offline".
 - onError -- The Connect agent encountered a system error.
 - onAfterCallWork -- The Connect agent entered "After Call Work".
 - onInit -- The Connect agent has logged in.
- Amazon Connect Voice Contact
 - onIncoming -- The voice contact is incoming. Note: This event fires for queued callback contact only.
 - onConnecting -- The voice contact is connecting. Note. This event fires for inbound and outbound contacts except queued callback contacts.
 - onConnected -- The voice contact is connected.
 - onEnded -- The voice contact is ended or destroyed.
 - onRefresh -- The voice contact is updated.
 - onAccepted -- A voice contact is accepted.

- onPending -- The voice contact is pending.
 - onMissed -- The voice contact is / was missed.
 - onDestroy - The voice contact is destroyed.
- Amazon Connect Chat Contact
 - onConnecting -- The chat contact is connecting.
 - onConnected -- The chat contact is connected.
 - onEnded -- The chat contact ended.
 - onRefresh -- The chat contact is updated.
 - onAccepted -- The chat contact is accepted.
 - onPending -- The voice contact is pending.
 - onMessageReceived -- A message was received from the customer
 - onMessageSent -- A message was sent to the customer
 - onMissed -- The chat contact was missed.
 - onDestroy - The voice contact is destroyed.
- Amazon Connect Task Contact
 - onIncoming -- The tasks contact is incoming.
 - onConnecting -- The task contact is connecting.
 - onConnected -- The task contact is connected.
 - onEnded -- The task contact ended.
 - onRefresh -- The task contact is updated.
 - onAccepted -- The task contact is accepted.
 - onPending -- The voice contact is pending.
 - onMissed -- The task contact was missed.

- onDestroy - The voice contact is destroyed.
 - onTransferInitiated -- When the server has initiated the task transfer.
 - onTransferSucceeded -- When the task transfer has succeeded.
 - onTransferFailed -- When the task transfer has failed.
 - onTaskExpiring -- Triggers 2 hours before the task expires.
 - onTaskExpired -- When the task has expired.
- Salesforce Agent
 - onStateChange -- The Salesforce agent's state changed.
 - onWorkAccepted -- The Salesforce agent accepted work.
 - onWorkloadChanged -- The Salesforce agent's workload changed.
 - Salesforce UI
 - onClickToDial -- A phone number, within the Salesforce UI, was clicked.
 - onNavigationChange
 - onHvsWorkStart

Appendix E: Integration with Salesforce High Velocity Sales

What is High Velocity Sales?

Salesforce HVS (HVS) is a process for your inside sales team to follow a repeatable pre-defined sales cadence for your business. It enables sales managers and representatives to work on a prioritized list of prospects and follow best sequence of sales outreach activities as defined by your sales process.

Enabling the Integration with High Velocity Sales

In order to make HVS works for your connect users, you must enable High Velocity Sales in your Salesforce Org.

Enable High Velocity Sales

1. From Setup, enter High Velocity Sales in the Quick Find box, then select High Velocity Sales.
2. Toggle "Enable High Velocity Sales Features" from disable to enable state

Call Outcomes for Branching

In this step, you can define call disposition values which can be used to branch sales cadence to define next best action for your sales process.

Define Call Outcomes for Branching

1. From Setup, enter High Velocity Sales in the Quick Find box, then select High Velocity Sales.
2. Edit the Define Call Outcomes for Branching.
3. Enter the call result values used by your org next to related call outcomes.

3 Configure High Velocity Sales

Define Call Outcomes for Branching RECOMMENDED

Call results are disposition values such as "Left Voicemail" that are captured when you log a call. Relate those values to call outcomes to display this data in reports and use it as branching criteria for sales cadences.

| Call Outcomes | Call Result Values |
|--|---|
| Displays in reports and the Sales Cadence Builder. | Enter related call result values. If you have multiple, separate each value with a comma. |
| Call Back Later | Call Back later, No Answer |
| Left Voicemail | Left Voicemail |
| Meaningful Connect | Connected |
| Not Interested | Not Interested |
| Unqualified | Unqualified |

Cancel Save

Assign HVS permission sets to Connect Users

For creating Sales Cadence, you need to have **High Velocity Sales Cadence Creator** permission set otherwise assign the **High Velocity Sales User** permission set to sales users.

Assign the permission set

1. From Setup, enter permission Sets in Quick Find box, and then select Permission Sets.
2. Select permission set, then click Manage Assignments to assign the permission set to users.

Create Sales Cadence

In HVS application, you will need to create a Sales Cadence based on Sales process

Create a Sales Cadence

1. Choose **Sales Cadence** from navigation menu.
2. Click the down arrow button then click **New**

3. Enter name and description. Click **Save** button which opens **Sales Cadence** builder screen.

The screenshot shows the Salesforce interface for building a sales cadence. On the left, there's a sidebar titled 'Recently Viewed' with a search bar and a list of items. The main area is titled 'New Sales Cadence' and contains sections for 'Information' (Name and Description fields) and a preview of the cadence steps.

4. Click + sign in the builder to add a step. Choose a type of step you want to add for your sales cadence. Once you finish adding steps, click the **Activate** button. Once a sales cadence is active, you can add leads, contact, and personal accounts to Sales Cadence.

Assigning Prospects

You can assign a prospect to a Sales Cadence either on a prospect detail page or through an automated flow. In this example, using prospect detail page to assign a sales cadence.

The screenshot shows the Salesforce Contact page for a prospect named Jo Jim. The top navigation bar includes status steps: New, Contacted, Nurturing, Unqualified, and Converted. The main content area displays basic contact details: Title (Test), Company (Test), Phone ((212) 121-2111), and Email. A sidebar on the left titled 'Sales Cadence Steps' indicates that Jo Jim is not currently in a sales cadence. The central activity section is titled 'Activity' and contains tabs for 'Log a Call', 'New Task', and 'New Event'. It includes a text input field for logging calls ('Recap your call...'), a toggle switch for 'Email insights only' (disabled), and a 'Filters' section set to 'Within 2 months • All activities • All types'. Below these are sections for 'Upcoming & Overdue' activities and a note that the list is filtered. A blue button at the bottom right says 'Show All Activities'.

Click **Add to Sales Cadence** button to add this prospect to a Sales Cadence.

Create and Map Dispositions

In this step you need to add a disposition field on Activity object and map disposition options to what is defined in HVS call outcomes. In this example, I am going to create a picklist field and add it to default task page layout to track disposition value for each call.

Create and map disposition fields

1. Go to the Setup screen then click **Object Manager**
2. Click **Activity Object**
3. In Fields and Relationships section select **New**
4. Select a picklist field and choose **Next**
5. Enter require information and add HVS call outcomes as picklist options.
6. Select all default options and add this filed on Task page layout. (If there is already a field called **Call Result** on Task Page layout then remove it from the page layout.)
7. Choose **Save**

Field Information

| | |
|---------------------------|----------------------------------|
| Field Label | Call Result |
| Field Name | Call_Result |

Setup CTI Flows for High Volume Sales

Next you will need to create a new set of CTI Flows for High Volume Sales.

Configuring the CTI Flow

1. Log in into your Salesforce org and go to the **Service Console**

2. Expand the **navigation menu** by selecting the down arrow and choose **AC CTI Adapters**.

3. Select **ACLightningAdapter**

4. Scroll down to the **Scripts** section

5. Select New to create a new CTI Flow

6. In the **CTI Flow Name** field, enter **Voice onHvsWorkStart**

7. Make sure the checkbox for **Active** is selected

8. For the **Source**, select **Salesforce UI**

9. For the **Event**, select **onHvsWorkStart**

10. Provide a **Description**

11. Click **Save**.

12. Scroll down and click on the link **Voice onHvsWorkStart**.

14. Click **Upload** and find the file you just downloaded. You should now see this:**

15. Click **Save**

16. Go back to the CTI Adapter page and select **New** in CTI Flows section to create another CTI Flow.

17. In the **CTI Flow Name** field, enter **HVS Voice onConnecting**

18. Make sure the checkbox for **Active** is selected

19. For the **Source**, select **Amazon Connect Voice Contact**

20. For the **Event**, select **onConnecting**

21. Provide a **Description**

22. Scroll down and click on the link **HVS Voice onConnecting**.

24. Click **Upload** and find the file you just downloaded. You should now see this:

25. Click **Save**

26. Once you've created the flows refresh your browser and the new scripts will take effect.

Per the recipe you created above, a Task (Call Activity) object will be created and screen popped as each call is ringing to the agent. After each call, Amazon Connect puts the agents into the *After Call Work State*. As part of the CTI adapter, it pops up a task record where you can capture standard task related information. The task screen also requires an agent to enter the call outcomes.

Upon selecting the call outcome on task page, click save to persist data in Salesforce. After completing this action, when user change his state from *After Call Work State* to *Available state*, the CTI Adapter raises an event to sync the task's call result value with HVS Sales Cadence and generate the next outreach activities for associated prospect.

Appendix F: CTI Flow Blocks

If-else

Change the flow of your script depending on value of fields you fetch or store. This is a simple "if-else" utility for your flow.

HTTP Request

Make an HTTP request.

Get Property

Fetches a property from the local data store. You can access a property you have retrieved from the local store by referring to the return value of this block.

Get All Properties

Returns all stored properties.

Format Phone Number

Formats a phone number for a country code.

Format Phone Number (E164)

Formats a phone number for a country code in E164 format.

Format a Date object

Returns a formatted date.

Is Truthy?

This is a utility to branch your flow depending on the truthiness of a value.

Set Property

Assigns a value to a property in the local data store.

Log to Console

Sends a static or dynamic value from an action to a logger.

Show Modal

The command to open modal.

Enable Click To Dial?

The query to determine whether Click to Dial should be enabled.

Enable Click To Dial

The command to enable Click to Dial.

Disable Click To Dial

The command to disable Click to Dial.

Get App View Info

The command to get App View information.

Get Softphone Layout

The query to get softphone layout.

Get Agent Workload on Salesforce

Returns the agent's current workload.

Complete High Velocity Sales Work With Task Saved

This methods allow your CTI implementation to communicate with High Velocity Sales (HVS) to handle HVS work.

Refresh View

The command to refresh the view.

Show Softphone Panel

The command to show softphone panel.

Hide Softphone Panel

The command to hide softphone panel.

Set Softphone Panel Height

The command to set the height of softphone panel.

Set Softphone Panel Width

The command to set the width of softphone panel.

Screenpop Object

The command to open a screenpop with information from object.

Screenpop Url

The command to screenpop a url in a new browser tab or browser window.

Screenpop Object Home

The command to screenpop to an object's home page.

Screenpop List

The command to screenpop a list view.

Screenpop Search

The command to screenpop search results based upon the search input. Not to be confused with "Search And Screenpop."

Screenpop New Record

The command to screenpop to a new record of the specified type with specified default field values.

Search And Screenpop

This command searches objects specified in the softphone layout for a given string. Returns search results and screen pops any matching records. Not to be confused with "Screenpop Search."

Run Apex

The command to run an apex method. Make sure the apex method is in a class that extends the AC_Utils class, and your class must be specified in the extensions list of `AC_CtiScript__c.page` Visualforce

page. See the Salesforce documentation for an example.

Get Agent State from Salesforce

The command to get an agent's state.

Set Agent State on Salesforce

The command to set an agent's presence state on Salesforce.

Login Agent on Salesforce

The command to login an agent on Salesforce.

Logout Agent on Salesforce

The command to logout an agent on Salesforce.

Save (or Create) a Record

The command to save or create a Salesforce object.

Create a Task

The command to create a Task. (The Subject of the task will be a string made up of upto 3 field values.)

Is Contact "Do Not Call"?

The query to check if the Contact requested not to be called.

Dial Number

The command to dial a phone number or to conference to an endpoint.

Mute Agent

The command to mute the agent.

Unmute Agent

The command to unmute the agent.

Get Agent Status from Connect

The command to get the current presence status of the agent from Connect.

Set Agent Status on Connect

The command to set the current presence status of the agent on Connect.

Set Agent Status By Name on Connect

The command to set the current presence status of the agent on Connect by name of the state.

Set Agent as Available on Connect

The command to set the current state of the agent to "Available."

Get Quick Connection List

Gets the list of quick connects available to the current agent

Get Transfer Connection List

Gets the list of quick connects available to the current agent.

Get Endpoint by Phone Number

Generates and returns an endpoint for a provided phone number.

Get Available Agent States

Gets all of the available agent states including custom states.

Get Agent Name

Returns the agent's user friendly display name for the agent.

Get Agent Extension

Returns the phone number that is dialed by Amazon Connect to connect calls to the agent for incoming and outgoing calls, if softphone is not enabled.

Get Agent Deskphone Number

Returns the phone number that is dialed by Amazon Connect to connect calls to the agent for incoming and outgoing calls, if softphone is not enabled.

Is Agent Softphone Enabled?

Checks if agent softphone is enabled. Branches in different directions if it is or not.

Change Agent to Softphone

Changes the current agent to softphone mode.

Change Agent to Deskphone

Changes the current agent to desktop phone mode with the specified phone number.

Get Agent Configuration

Returns the phone number that is dialed by Amazon Connect to connect calls to the agent for incoming and outgoing calls, if softphone is not enabled.

Get Agent Dialable Countries

Returns the list of dialable countries for the current agent.

Create Task Contact

The command to create a task contact that is sent to the provided quick connect endpoint. The quick connect must be available to any queue the agent has access too.

Get Contact Attribute

The command to get value of an attribute from the contact in the current session.

Is Voice Contact?

The command to determine if the contact is a voice contact.

Is Chat Contact?

The command to determine if the contact is a chat contact.

Is Task Contact?

The command to determine if the contact is an amazon connect task contact.

Is Contact Inbound?

The command to determine if the contact is inbound.

Is Contact Transfer?

The command to determine if the contact is transferred.

Is Callback?

The command to determine if the contact is a queue callback.

Get Contact Properties

The command to get properties of a contact.

Get Customer Phone Number

The command to get customer phone number of a contact.

Get Contact Interaction Metadata

The command to get metadata about a contact interaction.

Pop Task Contact's Reference Urls

The command to pop any reference urls if the contact is a task. Returns the number of urls popped.

Query value

The query to execute an arbitrary SOQL statement and returns the results.

Get Salesforce Lead Id

The command to get a salesforce lead id using a formatted phone number.

Open Salesforce Primary Tab

Opens a new primary tab to display the content of the specified URL.

Open Salesforce Sub Tab

Opens a new subtab (within a primary tab) that displays the content of a specified URL.

Get Focused Primary Tab Object Id

Returns the object ID of the primary tab on which the browser is focused.

Get Focused Subtab Object Id

Returns the object ID of the subtab on which the browser is focused.

Call jQuery Method

Perform a method call on a jQuery selection with your arguments.

Replace String

Perform a .replace() method on an input string.

Text Starts With Value

Checks whether a text input starts with one of the values.

Text Ends With Value

Checks whether a text input ends with one of the values.

Join Strings

Concatenates 2 values into a string.

SOQL Query

The query to execute an arbitrary SOQL statement and returns the results.

Multiply

Multiply two numbers.

Divide

Divide two numbers.

Get Tab Object Map

Returns a map of all visible primary tabs and their associated objects (if available).

Close Salesforce Tab

Closes the Salesforce with a given id.

Delay

Delays execution for a period of time. (Keep in mind that your flow may be stopped if it runs longer than the maximum allowed execution window of 10 seconds.)

Get Primary Tab Ids

Returns all of the IDs of open primary tabs.

Get Tabs With Matching Url

Returns the ids of the primary tabs with the url matching a provided string.

Length

Returns the length of a value.

Slice

Returns the slice of a value.

Cast a Value to a Type

Cast an input value to a Javascript type, such as Number or String.

Get CCP Logs

The command to get the logs of agent from Connect.

Clear All Properties

Clears all stored properties.

Unset Property

Removes the value assigned to a property in the local data store.

Show Attributes

This command displays the contact attributes in the CCP overlay.

Is Task Contact?

Check if the contact is a task

Create Task Contact

Creating a new task contact with certain inputs.

Pop Task Contact's Reference Urls

Pop any reference urls that are related to the task contact

Start Recording

Use the contact recording API to start recording the call.

Stop Recording

Use the contact recording API to stop recording the call.

Update Contact Attributes

Use the Connect API to update the attributes of the current contact.

Get Payload

Retrieve the payload of the CTI Flow. (The payload can be configured by CTI Actions.)

Send Data to CCP Overlay

Send an object to Data panel of CCP Overlay.

Leave a Voicemail

Use Voicemail drops to leave a voicemail.
